SA	Standardised approach
SFT	Secured financing transactions
SVC	Solvency risk indicator
TLTRO	Targeted longer-term refinancing operation (ECB monetary operation)
XBRL	eXtensible Business Reporting Language

Introduction

Background

Since February 2011, the EBA has started collecting, on a quarterly basis, statistical information referring to a sample of 55 banks across 20 EEA countries, in order to compute 53 KRIs. KRIs are ratios providing early warning signs of trends, potential risks and vulnerabilities in the EU banking sector.

All their building components¹ relied on the existing COREP and FINREP reporting frameworks, previously endorsed by CEBS², and, therefore, a high degree of standardised concepts and definitions was ensured. However, not all competent authorities (CAs) had fully implemented these reporting guidelines and, as a result, they had to collect such data on a best-efforts basis, either: a) directly from the relevant financial institutions, or b) by mapping data available in national reporting formats onto the data items as defined in COREP and FINREP, or c) by using other sources to proxy the missing data.

To that end, KRIs constituted the minimum feasible set of metrics compiled by the EBA to undertake its micro-prudential analysis role and build meaningful risk dashboards and reports.

Over the past few years, the EBA has placed emphasis on uniform reporting requirements to ensure data availability and comparability. In particular, the EBA introduced the implementing technical standards (ITS) on supervisory reporting³, serving as the 'backbone' for the collection and compilation of EU supervisory statistics.

The ITS sets out the reporting requirements and defines the scope of institutions reporting frequency and the reference and remittance dates. These standards also include annexes specifying the reporting requirements in the form of templates and instructions. Additionally, they provide reporting instructions with a Data Point Model (DPM) and a set of validation rules that ensure consistent application of the requirements, as published on the EBA website.⁴ The EBA has also developed XBRL taxonomies to facilitate data exchanges for the data concerned.

In terms of content, the ITS cover fully harmonised supervisory reporting requirements for *solvency, large exposures, real estate losses, financial information, liquidity, leverage ratio and asset encumbrance* and provide a comprehensive set of harmonised data of all EU institutions. They also introduce harmonised definitions for non-performing and forborne exposures in order to promote

¹ Raw data involved in the KRI numerators and denominators, collected according to the EBA DC 031/2011.

² FINREP rev1 as published by CEBS 24 July 2007, COREP as published by CEBS 6 January 2010.

³ Commission Implementing Regulation (EU) No 680/2014, laying down implementing technical standards with regard to supervisory reporting of institutions according to Regulation (EU) No 575/2013 of the European Parliament and the Council.

⁴ See also: The [EBA publishes new DPM and XBRL taxonomy for remittance of supervisory reporting](#).

a full comparison of the asset quality of EU banks. The information deriving from the reporting requirements assists supervisors in their Pillar 1 monitoring and their assessments of Pillar 2 risks.

Box 1. Areas covered by the harmonised reporting requirements of the ITS on supervisory reporting

- a. Own funds requirements and financial information in accordance with Article 99 of Regulation (EU) No 575/2013;
- b. Losses stemming from lending collateralised by IP in accordance with Article 101(4)(a) of Regulation (EU) No 575/2013;
- c. Large exposures and other largest exposures in accordance with Article 394(1) of Regulation (EU) No 575/2013;
- d. Leverage ratio in accordance with Article 430 of Regulation (EU) No 575/2013;
- e. Liquidity coverage requirements and net stable funding requirements in accordance with Article 415 of Regulation (EU) No 575/2013;
- f. Asset encumbrance in accordance with Article 100 of Regulation (EU) No 575/2013;
- g. Supervisory benchmarking of internal approaches in accordance with Article 78(8) of Directive 2013/36/EU.

In light of the merits the ITS have brought – in terms of more granular information, data harmonisation, coverage, periodicity and timeliness – the EBA decided to enhance its set of KRIs, developing a comprehensive set of risk indicators (RIs).

In the same vein, a set of DRATs was also developed. These tools go beyond the classical definition of indicators, which is typically based on ratios. They use data presentation and visualisation techniques to increase the analytical power extracted by their underlying data components.

Purpose and structure of this Guide⁵

The primary purpose of this Guide is to serve the EBA compilers of risk indicators and internal users, presenting the risk indicators and the DRATs, and thus providing guidance on their concepts, data sources (i.e. precise ITS data points involved in their calculation), techniques upon which they are computed, and clarity on methodological issues that may assist in their accurate interpretation and use.

Furthermore, this Guide fosters transparency on the computation methodology, with regard to those indicators used in the context of the EBA official publications, such as the EBA's risk assessment report and the EBA Risk Dashboard. Most importantly, it informs the general public on how these indicators are computed.

Last but not least, this Guide enables other competent authorities to compute indicators following the same methodology, and thus compare, in a consistent manner, indicators for different samples of banks, as well as for the EU aggregates.

⁵ The Guide has benefited from the valuable contributions and useful remarks provided by the EBA work-stream on risk indicators (WSRI) and by members of the EBA Subgroup on Analysis and Tools (SGAT).

However, it has to be noted that this Guide is not intended to bind competent authorities and hence, it is not mandatory, but only aims at supporting computation of indicators, consistent with the EBA publications.

The Guide is a living document and, therefore, it may evolve periodically, reflecting new experiences and user needs or changes in EU supervisory reporting (i.e. ITS on supervisory reporting).

The Guide is structured in two parts. Part I presents the risk indicators by means of an introduction, along with a description of each of them, and concludes with a short reference to relevant methodological concerns, when those arise. Consequently, each risk indicator has been allocated either to one of the following eight categories, depending on the type of risk addressed (namely: *liquidity, funding, asset quality, profitability, concentration, solvency, operational and market risk*) or to the dedicated category for SME monitoring. Each of these categories has a dedicated chapter in Part I, while the Annex I, illustrates the risk indicators' ID, name, formula (mathematical equation), computation frequency, range of their potential values, and their use and the phenomenon they intend to measure. Annex II provides the calculations and graphical representations (matrices) of the DRATs.

Finally, Part II discusses selective methodological issues that may arise when compiling or using the risk indicators and DRATs.

Part I. Risk indicators by type of risk

I.1 Liquidity risk

I.1.1. List of risk indicators and relevant DRATs

Table 1: List of LIQs and relevant DRATs

Number	Name	Number	Name
LIQ 1	Core funding ratio (% of total liabilities) – ‘Turner ratio’	LIQ 11	Cash and trading assets to total assets
LIQ 2	Short-term wholesale funding Ratio (% of items providing stable funding)	LIQ 12	Cash, trading, and available-for-sale (AFS) assets to total assets
LIQ 5	Withdrawable funding (% of total liabilities)	LIQ 13	Financial assets held for trading to total assets
LIQ 6	Term funding (% of total liabilities)	LIQ 14	Financial liabilities held for trading to total liabilities and equity
LIQ 8	Repos to total liabilities	LIQ 15	Extremely high liquid assets to total liquid assets
LIQ 9	Funding via derivatives (% of total items providing stable funding)	LIQ 16	Retail outflows to retail inflows
LIQ 10	Firm specific currency concentration (% of total items providing stable funding)	LIQ_17	Liquidity coverage ratio (%)

Number	Name
DRAT 27	Liquid assets to items requiring stable funding ratio by currency

I.1.2. Introduction

Liquidity risk refers to the risk of a firm being unable to fund its increases in assets or to meet its financial obligations, as they fall due, without incurring unacceptable costs or losses through fund raising and asset liquidation. This can be either the result of the financial institution’s inability to manage unplanned decreases and changes in funding sources, or their failure to recognise or address changes in market conditions, that may affect the institution’s ability to liquidate assets quickly and with minimal loss in value.

A liquidity crisis could potentially have a negative impact on earnings and capital and, in the extreme, could cause the collapse of an otherwise solvent institution. Earnings and growth potential could also be negatively affected if an institution’s liquidity position constrains it from

undertaking a transaction at normal market price. Conversely, illiquidity may lead to foregone investment opportunities or fire sales of assets, which could ultimately result in insolvency.

The banking sector is particularly susceptible to liquidity risk, as credit institutions fulfil a maturity transformation role in the financial system. The main role of banks (or financial institutions) is to take short-term deposits and savings and invest these funds in longer-term assets, such as mortgages.

In this sense, liquidity risk is also considered to be a systemic risk. The interconnectedness and general correlation of performance among financial sector institutions means that contagion effects can arise from liquidity crises in individual institutions. This has historically manifested itself in the form of bank runs, when a single failed institution triggers depositor runs for other institutions as well.

Moreover, liquidity risk could have systemic effects through other mechanisms. As seen in recent times, uncertainty about the solvency of institutions can lead to liquidity hoarding and a subsequent 'drying up' of credit in short-term interbank lending markets; liquidity crises can subsequently have spill over effects on the real economy in the form of reduced credit availability.

1.1.3. Description of the relevant risk indicators

The set of LIQs are mainly sourced from COREP liquidity templates (e.g. C 51.00 and C 61.00) as well as FINREP templates.

This set of indicators considers the composition of assets and liabilities from the perspective of their impact on the institution's liquidity. Within this category, there are indicators that directly compare institutions' holdings of certain types of assets against certain types of liabilities. A prominent example is the Liquidity Coverage ratio (Regulation (EU) No 61/2015), which can be used to compare unencumbered, liquid assets with short-term cash flows given a severe liquidity stress scenario (LIQ 17). In the same vein, there are indicators that focus on the institution's asset composition or liability composition separately, such as the core funding ratio (LIQ 1).

On the assets side, liquidity indicators can be used to assess the relative liquidity of a firm's holdings, i.e. the ease with which banks could sell their assets without impacting prices, or to consider the institution's reliance on certain types of assets that form their liquidity buffers (e.g. LIQ 15). Please note that while liquidity may impact asset quality (see chapter 1.3) and vice versa, both concepts (and the respective indicators) differ substantially. Liquidity represents a risk category whereas asset quality may be understood as the compound of different asset characteristics, among which liquidity risk may be one.

Similarly, indicators on the liability side look at the balance between stable liabilities on the one hand and shorter-term or readily withdrawable sources of funding on the other hand. For instance, LIQ 5 outlines the proportion of liabilities that are withdrawable sources of funding, i.e. retail deposits and withdrawable liabilities from both financial and non-financial customers.

Due to the reporting requirements for major currencies, COREP liquidity templates also allow the analysis of liquidity risk for specific currencies (LIQ 10). Such indicators are important to consider, as liquidity is not always fungible across different currencies. A key use for such indicators is to identify potential liquidity shortfalls and risk areas for firms within different jurisdictions.

Besides these risk indicators, a DRAT covering liquidity has also been developed. These indicators can be compiled either at the institution level, assessing potential weaknesses in the positions held in a given currency, or at the level of the whole EU banking system in order to assess general patterns in the positions held in foreign currencies.

I.2 Funding risk

I.2.1. List of risk indicators and relevant DRATs

Table 2: List of FNDs and relevant DRATs

Number	Name	Number	Name
FND 1	Asset encumbrance to total assets	FND 18	Customer deposits to total liabilities
FND 2	Encumbrance of central bank eligible assets	FND 19	Proportion of short-term liabilities with encumbered assets
FND 3	Encumbrance of debt securities issued by general governments	FND 20	Proxy of secured funding
FND 4	Encumbrance of collateral received	FND 21	Available collateral for encumbrance to total liabilities
FND 5	Over collateralisation	FND 22	Share of deposits in non-domestic markets
FND 6	Contingent encumbrance	FND 23	Share of financial liabilities in non-domestic markets
FND 7	Encumbered assets at central bank	FND 24	Share of deposits of households and non-financial corporations
FND 8	% of total deposits covered by a deposit guarantee scheme to total liabilities	FND 25	Use of subordinated financial liabilities
FND 9	Debt securities to total liabilities	FND 26	Gains and losses of financial liabilities at fair value to their carrying amount
FND 10	Deposits from credit institutions to total liabilities	FND 27	Average interest expense of financial liabilities at amortised cost
FND 11	Loans and advances (excl. trading book) to total assets	FND 28	Covered bonds to total liabilities
FND 12	Debt-to-equity ratio	FND 29	Asset-backed securities to total liabilities
FND 13	Off-balance-sheet items to total assets	FND 30	Convertible compound financial instruments to total liabilities
FND 14	Annual growth rate of total assets	FND 31	Share of total liabilities in the accounting and regulatory scope of consolidation
FND 15	Annual growth rate of total loans	FND 32	Loan-to-deposit ratio for households and non-financial corporations
FND 16	Annual growth rate of total customer deposits	FND 33	Asset encumbrance ratio
FND 17	Loan-to-deposit ratio	FND 34	Average interest expense of deposits at amortised cost

Number	Name
DRAT 28	Term funding per currency

1.2.2. Introduction

Funding risk refers to the risk undertaken by a firm in accessing sufficient funds to meet its obligations when they fall due. Therefore, as in the case of liquidity risk, a bank's poor financial performance may lead to its reduced creditworthiness and, consequently, to its failure to access sufficient funds over a specific horizon. Implicitly, this will eventually make it unable to settle its obligations during this time.

Besides an institution's creditworthiness, the composition and quality of the funds (the so-called funding profile) are also important factors to identify the firm's funding risk profile. For instance, when a bank is able to finance itself at low costs – using customer deposits or other forms of long-term unsecured funds – it can be considered as an institution with a low funding risk profile.

Moreover, an analysis of asset encumbrance is critical to assess the ability of institutions to handle funding stress, as well their ability to switch from unsecured to secured funding under such stressed conditions. The main sources of asset encumbrance (i.e. the balance sheet liabilities for which collateral was provided by institutions) across the sample are repos, covered bonds issued, and over-the-counter derivatives or central bank funding such as TLTROs, ELA and so on. Banks may use their assets as collateral to facilitate either short-term funding (e.g. using repos) or long-term funding (e.g. using ABS or covered bonds to diversify their funding profile).

In this context, the EBA identifies 34 funding indicators and one DRAT (28).

1.2.3. Description of the relevant risk indicators

In general, FNDs can be divided into **two groups: indicators that are related to encumbrance of assets, and those relating to the composition and quality of funding and liabilities.** The former set of indicators, i.e. those based on asset encumbrance, consists of indicators FNDs 1 to 7 and FND 33, while the latter consists of FNDs 8 to 32 and FND 34 on funding and balance sheet structure.

Considering the specialisation of the above-mentioned indicators, it is clear that the indicators can't be analysed independently, as they do not provide a sufficient level of information about the bank's funding structure and related risk profile. However, when observed jointly, they show a good and overall picture of the associated funding risks.

The FNDs 9 to 18 are employed to measure funding risk and mainly concern the bank's balance sheet, providing a general overview of its evolution. More particularly, FND 17 and FND 18 offer an insight into how extensively loans can be financed by deposits, while the share of deposits in total liabilities may also provide a notion of the institution's funding profile. In the same way, FND 9 and FND 10 take a closer look at the share of the wholesale funding of the firm. Finally, FNDs 11 to 16 observe the balance sheet structure and the evolution of the main balance sheet items.

As far as it concerns the risk indicators for asset encumbrance, analysts should consider an asset encumbered if it has been pledged or if it is subject to any form of arrangement to secure, collateralise or credit enhance any transaction from which it cannot be freely withdrawn. This definition covers but is not limited to:

- **Secured financing transactions**, including repurchase contracts and agreements, securities lending and other forms of secured lending;
- **Various collateral agreements** – for instance, collateral placed for the market value of derivatives transactions;
- **Financial guarantees** that are collateralised;
- **Collateral placed at clearing systems**, CCPs and other infrastructure institutions as a condition for access to service;
- **Central bank facilities**;
- **Underlying assets from securitisation structures**, where the financial assets have not been derecognised;
- **Assets in cover pools** used for covered bond issuance.

Therefore, these risk indicators provide a deeper insight into the proportion of encumbered assets, proportionally to the total assets. Hence, knowledge about the volume and composition of the assets and collateral available for encumbrance can provide insights into the degree of leverage an institution has in raising additional secured funding.

Indicators FND 32 and FND 34 offer insights into the concentration of funding, its geographical distribution, and the quality of the secured and unsecured funding of an institution.

Complementary to these risk indicators, there is also a DRAT that fall under the area of funding. The DRAT 28 provides a breakdown by currency of term funding, as defined in the domain of the Net Stable Funding Ration (NSFR).

I.2.4. Further methodological issues and potential ways to address them

Despite the rich information available in the context of the ITS on supervisory reporting, additional information may also be deemed necessary in order to properly size a bank's funding profile. This funding profile can be enriched by analysing additional market data on the actual funding costs, the average saving rates, interbank rates for the major currencies, repo rates and capital market credit spreads.

However, there is still room for further developments. An area that is also not sufficiently covered concerns data regarding capital and the money market instruments of an institution. Furthermore,

the CDS spreads of an institution can also provide an indication of how markets evaluate an institution's creditworthiness. Consequently, the higher the likelihood of an institution defaulting, judging by its CDS spreads, the higher the chance this will be reflected in its funding risk profile.

I.3 Asset quality

I.3.1. List of risk indicators and relevant DRATs

Table 3: List of AQTs and relevant DRATs

Number	Name	Number	Name
AQT_1	Non-performing loans and debt securities net of impairments to prudential own funds	AQT_34	Impairments on financial assets to total operating income
AQT_2	Non-performing loans and debt securities net of impairments to Tier one capital	AQT_35	Annual growth rate of impairments on financial assets
AQT_3.1	Non-performing loans and debt securities to total gross debt securities and loans and advances (NPE)	AQT_36	Annual growth rate of past due (>90 days) loans and debt instruments and total gross impaired loans and debt instruments
AQT_3.2	Non-performing loans and advances to total gross loans and advances (NPL ratio)	AQT_37	Forborne non-performing exposures to total forborne exposures
AQT_3.2.1 to AQT_3.2.5	Share of non-performing loans and advances by counterparty sector (Central banks, General governments, Credit institutions, Other financial corporations and Non-financial corporations)	AQT_38.1	Share of non-financial corporations on total forborne exposures
AQT_3.2.5.1	Share of non-performing loans and advances by counterparty sector - Small and Medium-sized Enterprises (SMEs) (NPL)	AQT_38.2	Share of households on total forborne exposures
AQT_3.2.5.2	Share of non-performing loans and advances by counterparty sector - Large corporations (NPL)	AQT_39	Proportion of performing forborne exposures under probation
AQT_3.3	Non-performing debt securities to total gross debt securities (NPDS)	AQT_40	Coverage ratio for performing loans and debt securities
AQT_3.3.1 to AQT_3.3.5	Share of non-performing debt securities by counterparty sector (Central banks, General governments, Credit institutions, Other financial corporations and Non-financial corporations)	AQT_41.1	Coverage ratio of non-performing debt instruments

AQT_4.1 to AQT_4.6	Share of non-performing debt instruments by counterparty sector (Central banks, General governments, Credit institutions, Other financial corporations, Non-financial corporations and Households).	AQT_41.1.1 to AQT_41.1.6	Coverage ratio of non-performing debt instruments by sector (Central banks, General governments, Credit institutions, Other financial corporations and Non-financial corporations)
AQT_5.1 to AQT_5.6	Share of non-performing debt securities and loans by country (residency counterparty) (Central banks, General governments, Credit institutions, Other financial corporations, Non-financial corporations and Households)	AQT_41.2	Coverage ratio of non-performing loans and advances
AQT_6.1 to AQT_6.3	Share of impaired assets by type (Equity instruments, Debt securities and Loans and advances)	AQT_41.2.1 to AQT_41.2.5	Coverage ratio of non-performing loans and advances by sector (Central banks, General governments, Credit institutions, Other financial corporations, Non-financial corporations and Households)
AQT_7.1 to AQT_7.3	Share of impaired equity instruments by sector (Credit institutions, Other financial corporations and Non-financial corporations)	AQT_41.3	Coverage ratio of non-performing debt securities
AQT_8.1 to AQT_8.5	Share of impaired debt securities by sector (Central banks, General governments, Credit institutions, Other financial corporations and Non-financial corporations)	AQT_41.3.1 to AQT_41.3.5	Coverage ratio of non-performing debt securities by sector (Central banks, General governments, Credit institutions, Other financial corporations and Non-financial corporations)
AQT_9.1 to AQT_9.6	Share of impaired loans and advances by sector (Central banks, General governments, Credit institutions, Other financial corporations, Non-financial corporations and Households)	AQT_42.1	Level of forbearance (gross amount) (FBE)
AQT_10.1 to AQT_10.2	Accumulated impairment and accumulated change in fair value due to credit risk of debt instruments by country (Debt securities and Loans and advances)	AQT_42.1.1 to AQT_42.1.5	Level of forbearance (gross amount) for debt instruments (FBE) by sector (Central banks, General governments, Credit institutions, Other financial corporations and Non-financial corporations)
AQT_10.2	Accumulated impairment and accumulated change in fair value due to credit risk of debt instruments by country - Loans and advances	AQT_42.2	Level of forbearance - Loans and advances (gross amount) (FBL)

AQT_11	Proportion of exposures in default	AQT_42.2.1 to AQT_42.2.6	Level of forbearance (gross amount) for loans and advances by sector (Central banks, General governments, Credit institutions, Other financial corporations, Non-financial corporations and Households)
AQT_12	Value adjustments and provisions compared to original exposure	AQT_42.3	Level of forbearance - Debt securities (gross amount) (FBDS)
AQT_13	Risk Weight ratio (credit risk)	AQT_42.3.1 to AQT_42.3.5	Level of forbearance (gross amount) for debt securities by sector (Central banks, General governments, Credit institutions, Other financial corporations and Non-financial corporations)
AQT_14	Post-CRM exposure to original exposure	AQT_43	% growth of defaulted exposures during the period
AQT_15	EL amount compared to original exposure	AQT_44	Variation of allowances
AQT_16.1	Share of defaulted exposures by sector and country - General governments (Central, Regional and PSE), Central Banks, Multilateral Developments Banks and International Organisations	AQT_45	Variation of write-offs of securities by type of instrument : equity instruments
AQT_16.2 to AQT_16.4	Share of defaulted exposures by sector and country (Institutions, Corporates and Retail)	AQT_46	Net allowances of securities by type of instrument : debt securities
AQT_17.1	Share of newly defaulted exposures (or increase of defaults for the period) by sector and countries - General governments (Central, Regional and PSE), Central Banks, Multilateral Developments Banks and International Organisations	AQT_47.1	Level of performing forborne loans not under probation (of total loans) (all gross)
AQT_17.2 to AQT_17.6	Share of newly defaulted exposures (or increase of defaults for the period) by sector and countries (Institutions, Corporates, Retail, Equity and Other non-credit obligation assets)	AQT_47.2	Level of performing forborne loans under probation (of total loans) (all gross)
AQT_18	Share of resecuritisations	AQT_47.3	Level of non-performing forborne loans (of total loans) (all gross)

AQT_19	Share of impaired and past due collateralised loans	AQT_48.1	Non-performing loans and debt securities to total gross debt securities and loans and advances (NPE at amortised cost)
AQT_20	Quality of Off-Balance Sheet exposures (share of NP OBS exposures)	AQT_48.2	Non-performing loans to total gross loans and advances (NPL at amortised cost)
AQT_21	Net allowances for credit losses : debt securities and loans and advances	AQT_48.3	Non-performing debt securities to total gross debt securities (NPDS at amortised cost)
AQT_22.1	Share of fair value level for assets - Level 1	AQT_49.1	Non-performing loans and debt securities to total gross debt securities and loans and advances (NPE at fair value other than trading)
AQT_22.2	Share of fair value level for assets - Level 2	AQT_49.2	Non-performing loans to total gross loans and advances (NPL at fair value other than trading)
AQT_22.3	Share of fair value level for assets - Level 3	AQT_49.3	Non-performing debt securities to total gross debt securities (NPDS at fair value other than trading)
AQT_23	Share of large exposures in default	AQT_50.1	Coverage ratio of non-performing loans and debt securities (at amortised cost)
AQT_24.1 to AQT_24.2	Ratio of forborne assets by country (Debt securities and Loans and advances)	AQT_50.2	Coverage ratio of non-performing loans and advances (at amortised cost)
AQT_25	Past due (>90 days) but not impaired loans to total loans and advances	AQT_50.3	Coverage ratio of non-performing debt securities (at amortised cost)
AQT_26	Impaired and past due loans to total loans subject to impairment	AQT_51.1	Coverage ratio of non-performing loans and debt securities (at fair value other than trading)
AQT_27	Change in allowances by type of instrument : loans and advances	AQT_51.2	Coverage ratio of non-performing loans and advances (at fair value other than trading)
AQT_28	Past due (>90 days) but not impaired loans and debt securities to total loans and debt securities	AQT_51.3	Coverage ratio of non-performing debt securities (at fair value other than trading)
AQT_29.1	Coverage ratio (loans and debt securities)	AQT_52.1	Forborne loans and debt securities to total gross debt securities and loans and advances (FBE at amortised cost)
AQT_29.2	Coverage ratio (impaired loans)	AQT_52.2	Forborne loans to total gross loans and advances (FBL at amortised cost)

AQT_29.3	Coverage ratio of impaired debt instruments	AQT_52.3	Forborne debt securities to total gross debt securities (FBDS at amortised cost)
AQT_30	Total gross debt securities and loans subject to impairment	AQT_53.1	Forborne loans and debt securities to total gross debt securities and loans and advances (FBE at fair value other than trading)
AQT_31	Impaired financial assets to total assets	AQT_53.2	Forborne loans to total gross loans and advances (FBL at fair value other than trading)
AQT_32	Impaired debt instruments to total debt instruments subject to impairment	AQT_53.3	Forborne debt securities to total gross debt securities (FBDS at fair value other than trading)
AQT_33	Accumulated impairments on financial assets to total (gross) assets	AQT_54	Texas ratio

Number	Name	Number	Name
DRAT 25	Ranking of countries according to non-performing exposures (EUR million)	DRAT 30	Average PD of non-defaulted IRB exposures by exposure class
DRAT 26	Ranking of countries according to non-performing exposures to total financial assets	DRAT 31	Average PD of IRB exposures by exposure class
DRAT 29	Average LGD per exposure class		

1.3.2. Introduction

The asset quality framework reflects the quantity of existing and potential credit risks related with loan and investment portfolios (which are typically the majority of a bank's assets) and other assets, as well as off-balance-sheet transactions, which are granted or owned by an institution against various counterparties, such as corporates, retail customers, other credit institutions, governments and others.

Credit risk is most simply defined as the potential risk that a bank borrower or counterparty will fail to meet its obligations in accordance with the pre-agreed terms. The goal of credit risk management is to maximise a bank's risk-adjusted rate of return by maintaining credit risk exposure within acceptable parameters. Banks need to manage the credit risk inherent in the entire portfolio, as well as the risk in individual credits or transactions.

The effective management of credit risk is a critical component of a comprehensive approach to risk management and essential to the long-term success of any banking institution. This is therefore reflected on assets quality, as they show the existing and potential credit risks associated to loans and investment portfolios (which typically comprise the majority of a bank's assets).

The credit risk is one of the most relevant and supervised areas in a bank's business model. It is important to understand institutions' current state of play, monitor the trends and thus understand

vulnerabilities drivers, and be in a position to react taking supervisory measures. Thus, it is not surprising that we identified 158 asset quality indicators and 5 DRATs.

1.3.3. Description of the relevant risk indicators

Several AQTs have been identified in the context of the EBA risk indicators. Some of these ratios focus on the level of loan loss provisioning to cover defaulted, impaired or non-performing assets, while others cover different aspects of the asset quality concept, such as the fair value level according to IFRS and the importance of forbearance or exposures on re-securitised products.

Additionally, some of the indicators refer to more granular asset classes or counterparty sectors, such as corporates, large or foreign exposures towards borrowers in a country or group of countries, in a more detailed manner.

In general, AQTs can broadly be divided into seven categories.

In the **first group** we have thirteen indicators (namely AQT 1 to 5, 20, 37, 41 and 48 to 51, plus AQT 54, which covers the “Texas ratio”) **referring to non-performing exposures** (loans, debt securities). These assets are compared to other significant figures (such as Tier 1 capital), or show the level of coverage, encumbrance, or the share by country of such assets. The EBA definition of non-performing exposures builds upon the definitions of impairment and default according to IFRS and Regulation (EU) No 575/2013 (CRR). The NPE definition is broader than these notions, with the setting of common identification and discontinuation criteria (90 days past-due or unlikeliness to pay) to serve as a more harmonised asset quality indicator across Europe to compare the banking institutions one to another.

The **second group includes 20 indicators** (AQT 6 to AQT 10, 19, 25 to 36, 40 and 44) that specifically **refer to impaired assets**. More particularly, AQT 19 focuses on those impaired assets that have been collateralised, as this category can be considered particularly sensitive, since it may reflect the potential impact of cash flows (due to the costs for obtaining and selling the collateral) on whether or not foreclosure is probable. AQT 29 focuses on unimpaired loans’ coverage, as these assets are also likely to be allocated impairments on a collective basis.

AQT 22 analyses the structure of fair value assets based on their measurement methodology. The fair value hierarchy is a concept used in the accounting framework to reflect the way assets were evaluated in fair value within the books. In particular, there are three levels that reflect the inputs used to measure fair value, ranging from quoted prices in active markets to unobservable inputs. Level 3 demonstrates those assets that were valued relying on unobservable price inputs and, therefore, have now become a potential source of loss in case of overestimation. Hence, AQT 22 tries to reflect this kind of particular risk.

The fourth group of seven indicators, namely AQT 24, 38, 39, 42, 47, 52 and 53, refer to the level of forbearance, i.e. the share of forborne exposures. The use of forbearance is interesting when considered from a risk policy perspective, especially over several periods of time – for example, when steep increases occur – in order to assess whether there has been some change in the bank’s behaviour regarding this type of asset. This point of view may also reveal the share of successful

forbearance at a given point of time, which can be deduced by looking at the amount of forborne exposures that have been reclassified from the non-performing to the performing category (described as loans under probation) and/or by measuring the proportionality of reclassified forborne loans.

Four other indicators, AQTs 11, 16 and 17, and 43, refer to ‘defaulted exposures’, allowing a comparison to a certain extent with non-performing indicators.

A sixth group identifies four indicators, AQTs 12, 16 and 17, and 43, that **cover value adjustments and write-offs** (reducing the accounting value of an asset) by instrument (e.g. loans, equity etc.). Net value adjustments (flows of credit loss allowances, i.e. closing balance minus opening balance) provide information on the development of allowances for credit losses depending on the type of counterparty.

Finally, the **remaining 5 indicators**, AQTs 13 to 15 and 23 (including their sub indicators, e.g. by counterparty) are built based on COREP templates and provide **detailed information on defaulted exposures**, both outstanding and recorded during the observed period, regarding the EL compared to original risk exposures and risk-weighted measures. Among these, two indicators (AQT 18, AQT 23) cover the share of defaulted exposures within large exposures and re-securitisations.

Furthermore, all country breakdowns are subject to a threshold, and thus reported only by institutions whose foreign exposures are at least 10% of the total. Effectively, that means that all indicators based on them can be computed only for institutions with significant foreign exposures.

To conclude, four DRAT have been defined in the context of analysing asset quality. The first two, DRATs 25 and 26, propose a ranking of countries according to the absolute and relative amounts of non-performing exposures respectively, with data extracted from FINREP template F 20.04. These indicators could provide insights into the geographical areas where EU banks recognise more financial assets as non-performing. DRATs 29 and 31 consist of a matrix (for IRB banks only) for the average Probability of default (PD) and Loss Given Default (LGD) by exposure class. Such information could highlight the riskiest portfolios of the reporting institution.

I.3.4. Further methodological issues and potential ways to address them

Some of the above-mentioned indicators could be also presented using matrices – for example, with regard to those dealing with countries or country groups, or categories of assets (equity, loans, etc.), or counterparty sectors (households/retail, corporates, sovereign exposures types).

Furthermore, one should bear in mind that the Expected Losses (EL) used in AQT 15 are estimated and thus not effective values. They are very useful tools used for supervisors to assess the solvency of the banking industry. However, they should be compared with care to effective losses and defaults, as EL are calculated only for IRB exposures, and thus, do not reflect the whole amounts of the exposures.

I.4 Profitability risk

I.4.1. List of risk indicators and relevant DRATs

Table 4: List of PFTs and relevant DRATs

Number	Name	Number	Name
PFT 1	Staff expenses as % of total administrative expenses	PFT 23	Cost-income ratio
PFT 2	Staff expenses per total operating income	PFT 24	Return on assets
PFT 3	Administrative expenses per total operating income	PFT 25	Net interest income to total operating income
PFT 4	Tax rate on continuing operations	PFT 26	Net fee and commission income to total operating income
PFT 5	Interest income from households	PFT 27	Dividend income to total operating income
PFT 6	Interest income from credit institutions	PFT 28	Net realised gains (/losses) on financial assets and liabilities not measured at fair value through profit and loss to total operating income
PFT 7	% of interest income earned domestically	PFT 29	Net gains on financial assets and liabilities held for trading to total operating income
PFT 8	% of interest expenses spent domestically	PFT 30	Net gains on financial assets and liabilities designated at fair value through profit or loss to total operating income
PFT 9	% of dividend income earned domestically	PFT 31	Net other operating income to total operating income
PFT 10	% of fee and commission income earned domestically	PFT 32	Net income to total operating income
PFT 11	% of total net operating income earned domestically	PFT 33	Annual growth rate of total operating income
PFT 12	Structure of fee and commission income net – payment services	PFT 34	Average interest income for households
PFT 13	Structure of fee and commission income net – structured finance	PFT 35	Loan-deposit spread for central banks
PFT 14	Structure of fee and commission income net – asset management	PFT 36	Loan-deposit spread for general governments
PFT 15	% of total profit or loss earned/lost in domestic activities	PFT 37	Loan-deposit spread for credit institutions
PFT 16	% of total profit or loss earned/lost in non-domestic activities	PFT 38	Loan-deposit spread for other financial corporations
PFT 17	Return on investment (RoE analysis)	PFT 39	Loan-deposit spread for non-financial corporations

PFT 18	Leverage (RoE analysis)	PFT 40	Loan-deposit spread for households
PFT 19	Non-operating earnings (RoE analysis)	PFT 41	Net interest margin
PFT 20	Tax effect (RoE analysis)	PFT 42	Provisions for pending legal issues and tax litigation as % of own funds
PFT 21	Return on equity	PFT_43	Cost of risk
PFT 22	Return on regulatory capital requirements		

I.4.2. Introduction

A bank's profitability can be traced back to cyclical as well as structural aspects. Cyclical sources of profitability refer to, for instance, the level of the interest rates, the gradient of the yield curve, the availability of high-yield assets, the burst or development of asset price bubbles and the economic environment, such as the current phase of the business cycle or the level of competition in the financial sector.

On the other hand, structural reasons that determine a bank's profitability could indicate how well a bank reacts to business developments – such as an increasing banking activity over the internet – and, therefore, if the business model is appropriate and up to date. It can also indicate the structure of the economy as such and whether a bank has an appropriate business model to meet the demands, a bank's cost structure, relics from former management and business decisions. Examples of these points include portfolio decisions with long-term effects, a bank's management and how banks are affected by the regulatory environment.

There are several channels through which the risk of low profitability could materialise. A direct consequence is to encounter problems when seeking refinancing from the markets, i.e. other banks and investors are less willing to invest in the bank or lend it money. Further consequences of materialisation, and the points most worth noting, are that a **bank's equity shrinks** or that the bank may not be able to **generate new equity**. There are several ways in which a bank can answer to low profitability and all of them entail certain risks.

Profitability does not come without risks. In attempt to improve profitability, a bank could cut costs, which could possibly result in insufficient internal control structures or lead to increased legal and reputational risks that could effectively have severe financial consequences. In their attempt to increase profitability, banks may also engage in a search for yield, and thus invest into risky assets that could potentially cause problems if these risks materialise.

Furthermore, the **risk of asset price bubbles** may also increase when many banks invest in the same asset class. Another structural problem for banks' balance sheets arises when banks try to raise profitability by increasingly using maturity transformations. In addition, banks may try to change their business model, which is a complex task that requires experienced management to be involved.

I.4.3. Description of the relevant indicators

The first indicators give an overview perspective of banks' income. Indicators PFT 21 to PFT 33 were initially employed in the context of the KRIs and were intended to measure banks' profitability, which mainly concerns a bank's income and gives a general overview of the development of the overall profitability.

Then, additional indicators allowing a deeper understanding of profitability's roots were included. These additional indicators, PFTs 1 to 20 and PFTs 34 to 40, provide useful insights into the income structure, i.e. banks' business, or the cost structure. Thus, these indicators may help to detect shifts in business models and their potential to increase banks' revenues. They also ease international comparisons or peer-to-peer analysis, allowing for differences in the income structure of banks to be scrutinized, as well as to identify relevant outliers.

These additional profitability indicators can be broadly split into five groups: the **first set** focuses on the cost structure, namely staff and administrative expenses and taxes; the **second group** looks at the geographical structure of income and expenses; the **third** shows the structure of the interest income; and the fourth set focus on the structure of fee and commission income. Last but not least, in the so-called 'follow-the-money' approach, profitability indicators are put into perspective with regard to the bank's balance sheet information (see also Part II.6 "Follow-the-money" approach').

These indicators explain not only the main drivers of revenues, but also how meaningful are the amounts depleted with staff expenses. More particularly, **the first set contains PFTs 17 to 20, which are based on statement of profit or loss** and may assist analysts in understanding the main drivers of revenues and to determine the source of the underlying risks. Additionally, indicators PFTs 1 to 4 analyse how much of the administrative expenses can be attributed to staff expenses, and how many euros of staff or administrative expenses are required to earn one euro of total operating income. Thereby, it can be analysed how personnel-intensive or staff-dependent a bank's business model is.

Furthermore, these indicators can provide an overview of the cost structure of the bank. In a peer comparison, e.g. among banks with similar business models, these indicators also allow one to learn about the potential deficits of a bank. The risk indicator looking at the tax rate on continuing operations allows one to study how much of the earnings from continuing operations banks have to pay as taxes. This is, in particular, interesting if compared internationally.

In the second group, income and expenses are analysed separately, according to whether they are earned or spent domestically or non-domestically. PFT 15 and PFT 16 demonstrate the percentage of total profits or losses earned/lost in domestic (PFT 15) versus non-domestic activities (PFT 16).

Some indicators show information for the main sources of income by geographic origin. PFTs 7 to 11 provide a more granular view by analysing the main income and expenses according to their geographic origin. In particular, these PFTs demonstrate what percentage of interest income, interest expenses, dividend income, fee and commission income and total net operating income is

generated by domestic entities. All such indicators can contribute to our understanding of how dependent a bank's business model is on domestic and non-domestic income respectively.

The third group of indicators, PFTs 5 to 6 and 34 to 40, provides a more detailed insight into the origin of interest income. Specifically, what share of the interest income is generated by the business with households and credit institutions. These two indicators do not necessarily add up to a total of 100%, as there may be also other sources of interest income that are classified as less important in this analysis and thus are not observed separately (for example, the net interest income on interest-bearing assets).

The fourth group of indicators, PFTs 12 to 14, observes the sources of fee and commission income. Such indicators show the share of fees and commissions earned by the main activities of payment services, structured finance and asset management respectively.

Finally, the 'follow-the-money' approach starts from a widely used risk indicator – the return on equity (RoE) (PFT 21) – and is broken down into an indicator's tree. Basically, the idea is to drill down and split up the return on equity into its different components:

$$RoE = \frac{\text{Net operating Profit}}{\text{Assets}} \times \frac{\text{Assets}}{\text{Equity}} \times \frac{\text{Earnings before Tax}}{\text{Net operating Profit}} \times \frac{\text{Net Profit}}{\text{Earnings before Tax}}$$

Return on investment | 1/Leverage | Non-operating earnings

I.4.4. Further methodological issues and potential ways to address them

As illustrated in Part II of the Guide, some of the new indicators may involve numerators and denominators with either positive or negative signs. Occasionally, this may raise concerns about the interpretability of their results. Consequently, those profitability indicators with both negative numerator and denominator should be normally artificially transformed into negative (see also Part II.2 'Negative values in numerators and denominators of ratios'). This kind of adjustment is particularly required for this type of risk indicators.

The 'follow-the-money' approach, as explained in detail in Part II of this Guide, could be further studied by splitting the respective indicators into more granular subcomponents. At this stage, only few of the new risk indicators were defined in this context. To fully pursue the 'follow-the-money' approach, it would be necessary to define additional risk indicators.

I.5 Concentration risk

I.5.1. List of risk indicators and relevant DRATs

Table 5: List of CONs and relevant DRATs

Number	Name	Number	Name
CON 1	Total large exposures	CON 7	Residential mortgage loans to households
CON 2	Exposures over 10% of capital or EUR 300 million	CON 8	CRE loans
CON 3	10 largest exposures to institutions	CON 9	Interests in SPE
CON 4	10 largest exposures to unregulated financial entities	CON 10	Interests in asset managers
CON 5	Non-domestic assets	CON 11	Interests in other unconsolidated structured entities
CON 6	Residential mortgage loans		

Number	Name	Number	Name
DRAT 1	Distribution matrix of original exposure by sector and country	DRAT 13	Distribution of loans and advances to non-financial corporations by NACE codes and country
DRAT 2	Distribution matrix of defaulted exposure by sector and country	DRAT 14	Distribution of loans and advances cumulative impairments by NACE codes and country
DRAT 3	Distribution matrix of observed new defaults by sector and country	DRAT 15	Distribution of liquid assets among currencies
DRAT 4	Distribution matrix of provision coverage ratio by sector and country	DRAT 16	Total inflows minus outflows by currencies (A - B)
DRAT 5	Distribution matrix of write-offs by sector and country	DRAT 17	Exposures by sector (all portfolios)
DRAT 6	Distribution matrix of RWA by sector and country of non-defaulted exposures	DRAT 18	Exposures by sector (trading book)
DRAT 7	Distribution matrix of own funds requirements for credit risk (as calculated for capital buffers) by country	DRAT 19	Top 10 counterparties classified as institutions
DRAT 8	Distribution of overall losses from property by country group	DRAT 20	Top 10 counterparties classified as unregulated financial entities
DRAT 9	Distribution of loss rates from property by country	DRAT 21	Top 10 counterparties classified as non-financial corporations

DRAT 10	Distribution of FINREP assets and off-balance-sheet items by country	DRAT 22	Top 10 counterparties classified as institutions by number of large exposures
DRAT 11	Distribution of FINREP default rates by assets and off-balance-sheet items and by country	DRAT 23	Top 10 counterparties classified as unregulated financial entities by number of large exposures
DRAT 12	Distribution of FINREP coverage ratios by assets and off-balance-sheet items and by country	DRAT 24	Top 10 counterparties classified as non-financial corporations by number of large exposures

I.5.2. Introduction

This set of indicators aims at analysing concentration risk. Concentration risk (CON) refers to the risk of a financial institution suffering heavy losses, which could eventually lead to insolvency due to the default of a single counterparty or a set of counterparties. Monitoring excessive concentration is a key aspect, as most of the recent banking crises have resulted exactly from this type of risk (although they were amplified by other factors).

Concentration risk is important at micro and macro level. While the focus on single counterparties is more relevant at a micro level, aggregated data can reveal how a financial system concentrates such risks. Monitoring the significance of exposures towards counterparties revealing high PDs could also be of interest.

Nevertheless, for a banking system as a whole, the analysis of concentration on correlated counterparties, such as country, sector or collateral type, is of higher importance, as it can be used both to detect concentration risk as such and to examine possible contagion effects through interconnectedness.

I.5.3. Description of the relevant indicators

The first group of indicators (CON 1 to CON 4) are focused on large exposures. An exposure is classified as 'large' if it represents more than 10% of the Tier 1 capital of the institutions⁶

The remaining exposures reported under large exposures reporting can be grouped into four categories: 1) exposures over EUR 300 million; 2) the top 20 exposures when the reporting institution is using the IRB approach; 3) the top 10 exposures to institutions; and finally 4) the top 10 exposures to unregulated financial entities⁷.

CON 1 covers total large exposures (original) as a share of total (original) exposures and, therefore, it is intended to be the main indicator, referring to the concentration towards a single counterparty. CONs 2 to 4 respectively cover the first, the fourth and the fifth category as described above.

⁶ For more details, see Article 392 of the CRR.

⁷ In accordance with Article 394(2) of the CRR

While first group of indicators focused on large exposures, the second group of CONs 5 to 11 concern all exposures (with the last three focusing only on foreign exposures) and are, therefore, intended to measure the concentration on counterparties, which can be correlated.

CON 5 measures the degree of internationalisation for a bank or a banking system. CONs 6 to 8 measure the exposures to residential and commercial real estate loans, which are traditionally one of the main sources of potential risks for banks.

CONs 9 to 11 measure the interests in three categories of entities (which are connected to the reporting institution) that may as well be a source of risk, namely: securitisation vehicles, asset managers and other structured entities. For these indicators, the underlying data is available only on a semi-annual frequency.

I.5.4. Description of the relevant Detailed Risk Analysis Tools (DRATs)

In the context of the DRAT for concentration risk, matrices demonstrate the distribution of assets and exposures or other dimensions by country, sector (according to COREP and NACE breakdowns), currency or asset class. Such indicators could also be used to identify areas of excessive concentration or, more generally, to visualise the interconnectedness between countries or sectors through a map. For that reason, these indicators have been chosen to be included in this section, even though some of them could have also fallen under the categories of asset quality, profitability or liquidity.

The country tables consist of individual EEA Member States, along with additional 16 countries against which EU banks have the highest exposures. The number 16 has been chosen as the gap between the 16th and the 17th country (respectively, South Africa and Chile) is wider than between other positions. In parallel, exposures corresponding to the 17th country onwards start to be less significant in quantitative terms and their inclusion in the tables may add little value to the overall analysis.

Regarding sectoral breakdown, it is necessary to signal that COREP sectors are different for SA and IRB exposure and, therefore, they need to be grouped in order to facilitate comparability (for the relevant methodological issues, please refer to section I.5.3 below). NACE breakdowns are based on the higher class level of the standard (i.e. 19 sectors, identified by a single letter code). Otherwise, any further aggregation may have resulted in less relevant information.

Furthermore, DRATs 1, 7, 10, and 17 provide breakdowns of total exposures (or own funds requirements in the case of DRAT 7) by sector/instrument and/or country (the first two stem from COREP by exposure class, the other two from FINREP by sector and instrument).

DRATs 13 and 18 focus on two subsets of exposures – more particularly, loans to the non-financial sector and trading book. These indicators aim at monitoring, respectively, the so-called ‘sectoral risk’, and market risk/interconnectedness.

DRATs 2 to 5, DRATs 11 to 12 and DRAT 14 relate to defaults, losses and coverage ratios and, therefore, provide insight into from where problems may arise for a bank or a banking system. These are indicators related to asset quality and their concentration.

DRAT 6 shows the distribution or RWAs of non-defaulted exposures. Hence, it demonstrates the distribution of capital requirements and, compared with DRAT 1, it may be used to understand how risky each sector or country could be perceived by banks.

The reporting templates on IP losses are the basis for DRATs 8 and 9, which cover only EU countries. DRATs 15 and 16 refer to the currency concentration, thus focusing only on liquid assets for which data is available. Concretely, it should be noted that assets denominated in the bank's reporting currency are excluded. This implies that only the combination of banks with the same reporting currency will be considered significant for more details (see also Part II.5). Moreover, for the aggregates, reported currencies will not necessarily be the most significant ones, as a currency representing 5% only in one bank would be included, while, theoretically, another representing 4.9% in all other banks would be excluded. The final list of currencies to be displayed in that context can only be defined once sufficient back data is available and the currencies demonstrate their predominance.

Finally, DRAT 19 to DRAT 24 are derived from large exposures templates and they intend to rank the counterparty institutions by reporting institutions. These indicators determine those that are the most recurrent counterparties of EU banks, classified as institutions, unregulated financial entities and non-financial corporations.

1.5.5. Further methodological issues and potential ways to address them

For each large exposure, three different values are available: original exposure, exposure value before application of exemptions and Credit Risk Mitigation (CRM) (but after provisions), and exposure value after application of exemptions and CRM. Among them, the most suitable metric needs to be chosen and used for the computation of the relevant risk indicators.

Despite the fact that the second option seems the most suitable, as it is the value that qualifies an exposure to be flagged as 'large', it was decided to use the first option (original exposures). This is due to the fact that original exposures are collected in many templates and, therefore, when it comes to computing concentration ratios, it is easier to find a suitable denominator and comparative term. Indicators on the other two values could be added, provided that the denominator is consistent.

Additionally, all country breakdowns are subject to a threshold and thus reported only by institutions whose foreign exposures are at least 10% of the total. Effectively, that means all indicators based on these figures (CON 5 and DRATs 1 to 7 and 10 to 14) can be computed only for institutions with significant foreign exposures.

Alternatively, assuming that all the figures referring to institutions not reporting the geographical breakdown information are assigned to domestic totals, total exposures for COREP and total assets

and off-balance-sheet items for FINREP could also be used. However, this approach has the disadvantage of potentially underestimating foreign exposures for those institutions. A similar approach could also be used to add data on own country when they are not reported for all indicators based on template FINREP 20.00, such as DRATs 9 to 13.

Finally, exposure classes in COREP are different in the SA and in the IRB approach. Therefore, to make them comparable, a mapping is proposed, as illustrated in Annex II of the Guide. This implies some degree of approximation, as definitions are not exactly the same, but the only alternative would be to have separate tables for SA and IRB exposures and such tables, each providing a partial picture, would be of limited use.

I.6 Solvency risk

I.6.1. List of risk indicators and relevant DRATs

Table 6: List of SVCs and relevant DRATs

Number	Name	Number	Name
SVC 1	Tier 1 capital ratio	SVC 16	IRB shortfall to total Tier 1 capital
SVC 2	Total capital ratio	SVC 17	Net DTA that rely on future profitability to total Tier 1 capital
SVC 3	CET 1 capital ratio	SVC 18	Adjustments to CET 1 due to prudential filters to total Tier 1 capital
SVC 4	Credit risk exposure amounts of total risk exposure amounts	SVC 19	Deductible goodwill and other intangible assets to total Tier 1 capital
SVC 5	SA risk-weighted exposure amounts of total credit risk exposure amounts	SVC 20	Defined benefit plan assets to total Tier 1 capital
SVC 6	Securitisation risk exposure amounts of total credit risk exposure amounts	SVC 21	Capital and share premium to total equity
SVC 7	IRB approach risk exposure amounts of total credit risk exposure amounts	SVC 22	Accumulated OCI to total equity
SVC 8	Market risk exposure of total risk exposure amounts	SVC 23	Retained earnings and reserves to total equity
SVC 9	Operational risk exposure of total risk exposure amounts	SVC 24	Treasury shares to total equity
SVC 10	Settlement risk exposure of total risk exposure amounts	SVC 25	Minority interests to total equity
SVC 11	Other risk exposure of total risk exposure amounts	SVC 26	Equity to total liabilities and equity
SVC 12	Leverage ratio (fully phased-in definition of Tier 1)	SVC 27	Tier 1 capital to 'total assets – intangible assets'
SVC 13	Leverage ratio (transitional definition of Tier 1)	SVC 28	Annual growth rate of RWAs
SVC 14	Regulatory own funds to accounting own funds	SVC 29	CET 1 (fully phased-in definition)
SVC 15	Transitional adjustments due to grandfathered CET 1 Instruments to total Tier 1 capital	SVC 30	Total capital ratio (fully phased-in definition)

I.6.2. Introduction

Solvency risk can be understood as the risk of an institution lacking the ability to absorb losses or decrease in earnings. Hence, insolvent firms have persistently and disproportionately large liabilities compared to RWAs. As a result, banks are unable to borrow further funds so as to face unexpected loss events. Specific regulatory capital requirements and compulsory values for SVCs are the most traditional measures that supervisors have used to avert such bank failures.

Noticeably, some of the indicators included in this risk type are so crucial that they have been set as a legal requirement that institutions need to abide with.

I.6.3. Description of the relevant risk indicators

SVCs, such as SVCs 1 to 11 and SVCs 26 to 28 respectively, are employed for measuring solvency risk and are mainly concerned with the composition of an institution's risk profile, the compulsory capital requirements indicators, compliance level and the divergence of regulatory capital from accounting figures. They are all structured in such a way that would facilitate monitoring and assessment of regulatory capital-requirements compliance from period to period.

The rest of the SVCs can be broadly structured into four categories:

- SVCs 12 to 13 and SVCs 29 to 30 observe the mandatorily calculated regulatory leverage ratios related to own funds, as prescribed by Regulation (EU) No 575/2013;
- SVC 23 compares the published financial statements' own funds against supervisory capital. A large divergence between these ratio components signals low future loss-absorbing ability and an adversely high impact of prudential filters (see Article 32-35, Regulation (EU) No 575/2013);
- The ratios of SVCs 21 to 26 elaborate the composition of the core components of the accounting equity;
- The ratios of SVCs 16 to 20 decompose transitional or phase-in adjustments to regulatory own funds allowed by the competent national authorities, and are intended to measure solvency risk for the institution in the case that national discretions are lifted.

I.6.4. Further methodological issues and potential ways to address them

Ratios which decompose transitional or phase-in adjustments to regulatory own funds (SVCs 12, 13, and 15 to 20) have Tier 1 as a denominator, as a minimum Tier 1 ratio is prescribed by Article 92(1)(b) of Regulation (EU) No 575/2013 and it contains the largest amount of adjustments between the two options for a denominator (CET 1 or Tier 1). In addition, CET 1 and total capital ratio are computed with fully phased-in definitions.

I.7 Operational risk

I.7.1. List of risk indicators and relevant DRATs

Table 7: List of OPRs and relevant DRATs

Number	Name	Number	Name
OPR_1	Total Risk Exposure for Op Risk (% of Total Risk Exposure)	OPR_6	Internal Fraud Loss as percentage of total OpR Loss
OPR_2	OpR BIA Risk Exposure (% of Total Risk Exposure OpR)	OPR_7	External Fraud Loss as percentage of Total OpR Loss
OPR_3	OpR STA/ASA Risk Exposure (% of Total Risk Exposure OpR)	OPR_8	Business Disruption and System Failures Loss as percentage of Total OpR Loss
OPR_4	OpR AMA Risk Exposure (% of Total Risk Exposure OpR)	OPR_9	Total Risk Exposure for OpRisk compared to Total Risk Exposure for Credit Risk
OPR_5	Total OpR Loss as Percentage of Own Funds Requirements for OpR	OPR_10	Total Risk Exposure for Trading Risk compared to Total Risk Exposure for OpR

I.7.2. Introduction

OpR can be described as the risk of loss resulting from inadequate or failed internal processes, systems and people intervention, or from external events.

A representative selection of different OpR types included in this context is:

- People: may include fraud, breaches of employment law, unauthorised activity, key person risk, inadequate training or supervision;
- Processes: failures in payment or settlement, deficient documentation, valuation or pricing errors, project management failures and internal or external reporting problems;
- Systems: typically, this would include system failures, errors in system development and implementation, and inadequate IT resources;
- External events: these would include, amongst others, crime, outsourcing risks, natural disasters, regulatory and political risks, as well as competition.

To that end, OpR usually reflects losses that are identified in a number of event types included in the new reporting framework, as follows:

1. Internal fraud: this category would include misappropriation of assets, tax evasion, and bribery;

2. External fraud: this would cover, for example, theft of information, hacking damage, third-party theft and forgery;
3. Employment practices and workplace safety: this would include, for example, discrimination, employee compensation, and worker health and safety;
4. Clients, products and business practices: this category would include market manipulation, antitrust and account churning;
5. Damage to physical assets: this would occur due to natural disasters, terrorism, vandalism, and so on;
6. Business disruption and system failures: software or hardware failures and disruption of services;
7. Execution, delivery and process management: data entry errors, accounting errors and failed reporting requirements.

Even though legal risk is included as the risk of changing legislation and arbitrary court decisions, it excludes strategic and reputational risks.

OpR, by its nature, is unavoidable and it is neither willingly incurred nor is revenue driven. Moreover, it is not diversifiable and thus it cannot be fully eliminated. However, it can be transferred (e.g. by insurance).

OpR is manageable to some extent by introducing proper controls that would keep relevant losses within the risk appetite levels defined by the board of a bank. Thus, OpR is ultimately all about the failure of controls.

1.7.3. Description of the relevant risk indicators

OpR requires a specific type of management, as well as data collection processes, to cover both the high frequency and low cost events but also the low frequency and high impact events throughout the institution.

The first group of indicators covers OPRs 1 to 4 and 9 and 10 fall in this group and they intend to **measure the relative importance of OpR exposures** and subtypes compared to other risk exposures (either the total, from other risk categories, or within the OpR category).

In general, low values are expected for these indicators compared to other risk classes, as OpR should not be one of the main risk categories in the institution's business model.

However, trends over time and spikes such as low frequency or high impact events, along with peer group analysis, could provide an indication of the overall quality of controls the institution has in place to manage this type of risk.

Some of these indicators provide information on the size of the risk exposure for different OpR measurement approaches, such as OPRs 2, 3 and 4.

The second group of risk indicators provide insight into the loss size across different event types as well as overall. Higher proportions of an event type may indicate areas where controls need to improve or where remedial actions need to be put in place.

These indicators attempt to provide an indication of the high or low impact of the OpR compared to the number of events that have occurred in the institution for a given period of time. Special attention should also be paid to those cases where a few events have a high impact in the institution, as these could cause a destabilising effect and are more difficult to control and manage.

Despite the increased number of risk indicators that can be computed across each event and business line combination, this study concentrates on the main types that can give a general flavour of what the level of OpR is in a particular institution.

1.7.4. Further methodological issues and potential ways to address them

A few methodological issues need to be considered, which mainly affect the availability of data for the calculation of the risk indicators.

Regarding the relevant indicator for years -3, -2 and -1, this is generally the net interest income plus the net non-interest income. The methodological issue is due to the accounting standard base on which this will be calculated (GAAP vs IFRS). Therefore, the use of different standards may affect the comparability of the final computed ratios.

Template C 06.00 (group solvency) is filled in by entities providing data on a consolidated basis and, therefore, this may impact OPR 5 and OPR 6;

Reporting obligations for templates C 17.00.a and C 17.00.b depend on the methodology the institution uses.

- BIA:
Templates are not required when an entity reports OpR under the basic indicator approach.
- TSA/ASA:
Institutions under these approaches are expected to report only rows 910, 920, 930, 940 and column 080 of template C 17.00.a, which are the total of business lines and total of event lines, if the total individual assets (FINREP) <1% total individual assets in the country. If it is higher than 1%, then they would report the full template.

Templates used for the computation of OpR indicators have different frequencies. For example, templates C 17.00.a and C 17.00.b are semi-annual, while the rest are quarterly, meaning that there will be two quarters where there will be no data available to compute risk indicators feeding from these templates.

I.8 Market risk

I.8.1. List of risk indicators and relevant DRATs

Table 8: List of MKRs and relevant DRATs

Number	Name	Number	Name
MKR 1	OTC trading derivatives to total trading derivatives	MKR 8	Share of risk exposure amounts of foreign exchange to risk exposure amounts
MKR 2	Commodities trading derivatives to total assets	MKR 9	Share of risk exposure amounts of commodities to risk exposure amounts
MKR 3	Commodities derivatives to total assets	MKR 10	Stress indicator
MKR 4	Total long positions in non-reporting currencies to total long positions	MKR 11	Total unsettled transactions to risk-weighted exposure amounts
MKR 5	Total short positions in non-reporting currencies to total short positions	MKR 12	Total unsettled transactions for more than 46 days to total unsettled transactions
MKR 6	Share of risk exposure amounts of traded debt instruments to risk exposure amounts	MKR 13	Proportion of derivatives and SFT to total risk-weighted exposure amounts
MKR 7	Share of risk exposure amounts of equity to risk exposure amounts	MKR 14	Total long and short positions on commodities to total exposures

I.8.2. Introduction

Market risk can be defined as the risk of losses in on-balance-sheet – and, in rare cases, on off-balance-sheet – positions arising from adverse movements in market prices. From a prudential point of view, market risk stems from all the positions included in banks’ trading book, as well as from commodity and foreign exchange risk positions in the banking book.

Furthermore, positions in the AFS portfolio and financial assets and liabilities designated at fair value may also bear some degree of market risk. Traditionally, trading book portfolios consist of liquid positions that are easy to trade or hedge.

However, recent developments in the banks’ portfolios have led to an increase in illiquid positions not suited to the original market capital framework. Therefore, as market risk has a wider impact than only on liquid trading book positions, the need to have a more comprehensive view has increased.

I.8.3. Description of the relevant risk indicators

Overall, MKRs provide deeper insights into the role of various market risk portfolios and exposure types.

More particularly, these indicators can be structured into the following categories:

- MKR 6 to MKR 9, MKR 11, and MKR 13, which describe 'risk-weight exposure amount' participation by instrument type. High values on these indicators usually point to the instrument types that aggravate capital-adequacy compliance;
- MKR 4, MKR 5 and MKR 14, which decompose the long or short positions of the institution. Such analysis is especially valuable in cases where market conditions render the liquidation of buyers' positions more difficult than sellers' positions or vice versa;
- MKR 13, which explicate the marketability of trading book positions at the time of reporting;
- MKR 1 to 3, which demonstrate the trading activity of commodities or derivatives as reflected in the trading book or the balance sheet when carried out in a given period;
- MKR 10, which is specially targeted for institutions using internal models that measure how current value-at-risk compares to the stressed value-at-risk. MKR 8 measures FX-risk participation within the total market risk own funds requirements faced by an institution using the SA.

I.8.4. Further methodological issues and potential ways to address them

The application of additional market risk ratios, especially with regard to internal models, is vital to avert sudden and possible failures that could eventually cause losses. Therefore, geographical or currency analysis of certain instrument types can uncover major potential risks for the reporting institution. At the same time, the set of legally binding reporting templates is, by nature, limited and cannot always expose specific inefficiencies in the risk handling that concerns the trading portfolio.

On a more practical basis, after examining the list of risk indicators, supervisors should also try to determine any hidden market risk within the banking book and especially in relation to the movements of balances within the AFS portfolio, prudent valuation adjustments or credit value adjustments (CVA).

The 'arbitrage' of capital requirements, which refers to the exchange of market risk capital requirements for lower credit risk capital requirements, can only be avoided after both the banking book and the trading book have been evaluated simultaneously and over different reporting time points.

I.9 SME risk indicators

I.9.1. List of risk indicators and DRATs

Table 9: List of SME risk indicators and DRATs

Number	Name	Number	Name
SME 1	Share of SME exposures in total exposures	SME 8	PD for SME exposures
SME 2	Share of SME exposures in exposures to the real economy (corporates, retail and secured by IP)	SME 10	LGD for SME exposures
SME 4	% change (year-on-year) of SME exposures during the period	SME 12	Share of SME exposures in default in total SME exposures
SME 6	Risk weighted ratio for SME exposures for SA/IRB approach	SME 13	% change (year-on-year) of defaulted SME exposures during the period
SME 7.1	Risk weight ratio for SME exposures subject to SME supporting factor for SA	SME 14	Post-CRM SME exposure to original SME exposure

I.9.2. Introduction

In accordance with Article 8(1)(f) of the Regulation (EU) No 1093/2010 on establishing a European Supervisory Authority, the EBA shall ‘monitor and assess market developments in the area of its competence, including, where appropriate, trends in credit; in particular, to households and SMEs’. Therefore, it seems natural for the EBA to develop indicators with a view to monitor the SME lending trends in the EU on an ongoing basis.

I.9.3. Description of the relevant risk indicators

The purpose of SME monitoring is to keep track of lending trends to SMEs and their riskiness in the context of the banking sector.

As such, the following groups of indicators are proposed:

- SMEs 1, 2 and 4 refer to SME lending indicators, which provide information on the lending trends to SMEs and their importance in terms of SME exposures in the overall banking sector;
- SMEs 6 to 13 on SME riskiness indicators provide information about the asset quality and the riskiness of SME related assets;
- SME 14 refers to the dependency on credit protection and provides information on the extent to which SME exposures are covered by credit protection;

More particularly, SME 1 covers the share of SME exposures in total exposures and thus gives broader information on the weight of SME exposures in total bank exposures. SME lending is based on the non-harmonised SME definitions used by each bank.

SME 2 reflects the share of SME exposures in exposures to the real economy (corporates, retail, and secured by IP) and allows the assessment of the relative importance of SME lending as compared to other lending to the private sector. Exposures in default are included if under the SA approach, but excluded if computed under the IRB approach.

SME 4 monitors the annual growth of SME exposures during the period. This figure does not represent new business, merely growth in the exposure amount. This indicator offers information on the development (increases or decreases) in the volume of SME exposures, independent from their level.

SME 6 displays the risk weight ratio for SME exposures. It gives information on the average level of credit risk carried by SME assets, keeping in mind that the SME supporting factor has also been applied to some of these assets. This indicator takes into account credit risk mitigation techniques with substitution effects, which means that some SME exposures may be reported as another exposure class for the purpose of risk weighting and computation of overall own funds requirements.

SME 7 reflects the risk weight ratio for SME exposures subject to the SME supporting factor. It gives information on the average level of credit risk carried by SMEs subject to supporting factor assets.

SME 8 monitors the PD for SME exposures. It offers information on the PD associated with SME exposures in the case of IRB banks. It should be noted that part of the information on expected and unexpected loss is captured by LGD.

SME 10 gives information on the LGD associated with SME exposures.

SME 12 monitors the share of SME exposures in default in total SME exposures. It gives information on the relative importance of defaulted SME exposures among SME exposures, overall and by country. This indicator may be compared with the same value for other classes or across banks, as calculated in indicator AQT 11. It can also be computed for SME corporate, SME retail and SME secured by real estate.

SME 13 monitors the annual growth of defaulted SME exposures during the period. It gives information on the development (increases or decreases) of defaulted SME exposures, independent from their level.

SME 14 refers to the SME dependency on credit protection. It can be compared to the same values of all exposures as calculated in AQT 14. Only totals can be used due to the flow of amounts across exposure classes for reporting purposes, as based on CRM. This figure captures only credit protection that leads to the reduction in exposure value. CRM reduce the credit risk of an exposure or exposures via the substitution of exposures. It covers unfunded credit protection (guarantees, derivatives) and funded credit protection (e.g. financial collateral).

I.9.4. Further methodological issues and potential ways to address them

The CRR uses the term SMEs in two contexts. According to the first one, in order to be eligible for the retail exposure class, one of the conditions is that an exposure has to be an exposure to an SME (or one or more natural persons) in both the SA and the IRB approach, in accordance with Article 123 and Article 147 (CRR). The definition of SMEs is not specified for this purpose. However, the relevant reporting instructions⁸ state that for the identification of SMEs for the purposes of the articles of the CRR (other than Article 501), institutions may apply their own definition of SMEs using the Commission Recommendation 2003/361/CE of 6 May 2003 only as guidance.

In the second context, CRD IV/CRR has introduced a deduction in the capital requirements for exposures to SME exposures through the application of an SME supporting factor equal to 0.7619. To be subject to the SME supporting factor, SMEs are identified using the Commission Recommendation 2003/361/EC of 6 May 2003, applying only the turnover criterion (turnover should not exceed EUR 50 million). In addition, the exposures should be included in 'retail', 'corporate' or 'secured by mortgages on IP exposure classes and the amount owed should not exceed EUR 1.5 million, in accordance with Article 501 of the CRR.

⁸ The [EBA Single Rulebook Q&A 2013](#) 27

Part II. Other methodological issues for the compilation of risk indicators

The second part of this Guide is devoted to relevant methodological issues that could affect the intrinsic analysis extracted from the different indicators or should at least be taken into consideration when using these for analytical purposes.

II.1 Scope of the data

When analysing risk indicators, it is important to be aware of three facts that might not be directly observed, but can severely impact computed indicators and the economic meaning from the values they assume: (i) the **valuation methods** according to which the information is collected, (ii) the changes in the **reporting sample** when the indicator refers to an aggregation of reporting institutions, and (iii) the **level of consolidation**.

Despite the fact that, at a first glance, these issues seem to be totally unrelated, they all have an important feature in common: they are usually hidden behind the data and are often not adequately explained.

II.1.1. Valuation methods

The supervisory data reported by financial institutions, can be calculated according to different methods. These different approaches could have an effect on the reported figures themselves. For example, a loan granted by a credit institution to a customer can be reported under the ITS on supervisory reporting, at a **nominal value**, amortised **cost** or **fair value**, then with or without allowances, provisions and credit risk adjustments, as a risk exposure amounts or as an exposure value for instance (see Table 10). Even with such a stylised approach and without entering further levels of granularity, it becomes apparent that there are **seven different methods of measuring the same loan**.

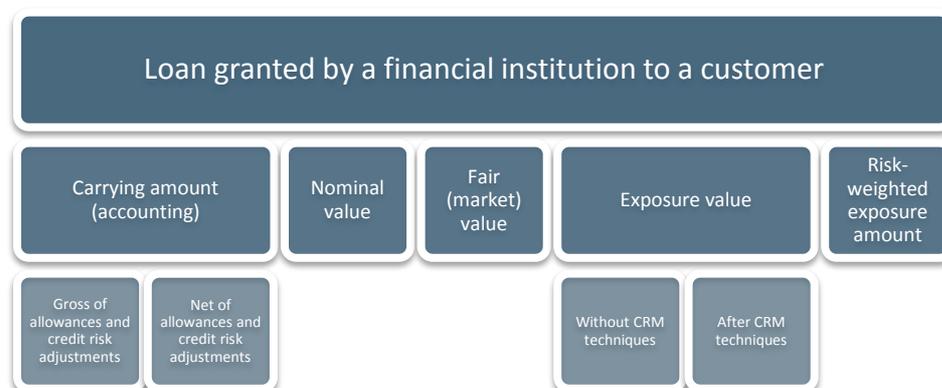

When the valuation method used for the collection of a given data point is not adequately expressed, there is a risk that the information could be misinterpreted by users, as they will not be able to understand how the reported amount is calculated and what this implies in terms of substance. Further to the above-mentioned loan example, even within the domain of accounting information, it is not the same to report a loan with or without allowances and provisions.

Moreover, in order to ensure an adequate level of quality, it is also required that components of an indicator include only granular data points using consistent valuation⁹ methods. The use of more than one valuation method may significantly hamper the relevant indicator's ability to provide

⁹ The same is valid for accounting frameworks in the specific case of financial information, as the aggregation of information prepared under different accounting frameworks generates more noise than added value.

meaningful information. In other words, mixing cost-based and fair-value-based amounts in the context of the same building component for an indicator, e.g. numerator or denominator, may severely distort the content of this particular data point.

Table 10: Different methods of measuring the same loan

The indicators presented in this Guide will not be affected by limitations laid down in the previous paragraphs, as they always stem from a distinctive EU-wide harmonised reporting framework (FINREP and COREP templates), where valuation methods are clearly defined and used in a distinguished manner. This is certainly one of the benefits the implementation of the EBA ITS on supervisory reporting brings to the field of supervisory reporting.

In any case, such differences in valuation methods shall be borne in mind when comparing indicators stemming from different reporting frameworks – for example, carrying amounts in FINREP against exposure values in COREP, where underlying valuations are usually different.

II.1.2. Composition of the sample

The composition of the sample is particularly important when performing a time series analysis. In particular, as the indicators refer to an aggregation of several reporting institutions, it is especially important to keep track of all the possible changes occurred in the underlying data. This attention ensures that variations throughout different periods accurately reflect the evolution of the indicators and that they are not contaminated by changes such as institutions' mergers or acquisitions in the underlying reporting sample.

In an ideal world, the answer to such a change in data would be to adjust the indicators values to the new sample each time, by adding or removing the occurrence. Nonetheless, this option entails continuous work in changing the time series, which may, ultimately, end up hampering the overall quality of the underlying data. Furthermore, when the time series comprises a significant number of observations, the task becomes certainly burdensome. An intermediate solution is to consider two values for each observation: the first from the current period and one from the previous one. In this case, the volume of the information collected doubles, but, on the other hand, it is ensured that period-to-period variations reflect the actual evolution of this indicator.

A more pragmatic approach is to define strict criterion for the entry and exit of the reporting sample. In this way, every change in it is adequately documented and shared with information's users. In such cases, the quality of the information is not of the maximum possible level, but the record of additions and removals in the sample serves as a warning tool when looking at the time evolution of a given indicator.

This is the solution implemented by the EBA to disseminate information on EU's largest banks, as established by Decision EBA/DC/130.¹⁰ Article 3 of this Decision describes the entry and exit criteria for the sample, which have the clear objective of providing as much stability as possible to the sample of reporting institutions contributing to the computation of these risk indicators and DRATs. Institutions are required to leave the sample once the criteria set out in **Article 3 over 3 consecutive years** have not been fulfilled. The 3 consecutive year's condition exists to avoid those cases where an institution close to the entry threshold continuously enters and exits the sample. For the purpose of full transparency and accountability, the composition and evolution of the sample of reporting banks is published and periodically updated on the EBA website.¹¹

II.1.3. Level of consolidation and reporting requirements

In most cases, the ITS on supervisory reporting requires reporting both on an individual entity level and on a consolidated level. Consequently, there are different levels of consolidation to be applied when it comes to the submission of the information. If not known by the analyst and especially when aggregating reporting institutions, these levels of consolidation may hinder the quality and accuracy of the analysis. The following paragraphs briefly describe these issues.

The scope of consolidation in prudential regulation (CRD IV/CRR) is not the same as in accounting (financial reporting). In broad terms, while the latter includes all entities, regardless of their activities, under the control of the parent entity, the provisions in CRD IV/CRR exclude three groups of entities from the scope of consolidation: (i) **insurance corporations and other financial institutions**; (ii) **non-financial corporations**; and (iii) **entities not material in size for the group as a whole**. While these three groups of institutions are not expected to be core activities of any reporting institution, sometimes they give rise to non-negligible differences between the values reported in the accounting and in the supervisory domain. Thus, the ITS on supervisory reporting requires use of the prudential scope of consolidation for financial information as well.

FINREP templates F 17.01, F 17.02 and F 17.03 provide an overview of the size of these differences. In these templates the amounts are reported according to the accounting scope of consolidation. Although most of these differences are not expected to be significant, there are a number of causes where it can significantly change the final figures.

Furthermore, the current structure of the EU banking system is one where there are numerous large cross-border banks with activities in many EU countries. In each country, these activities are usually organised with a parent and different subsidiaries, so there is a consolidated group in that country. Under the provisions of the ITS on supervisory reporting, with the notable exception of

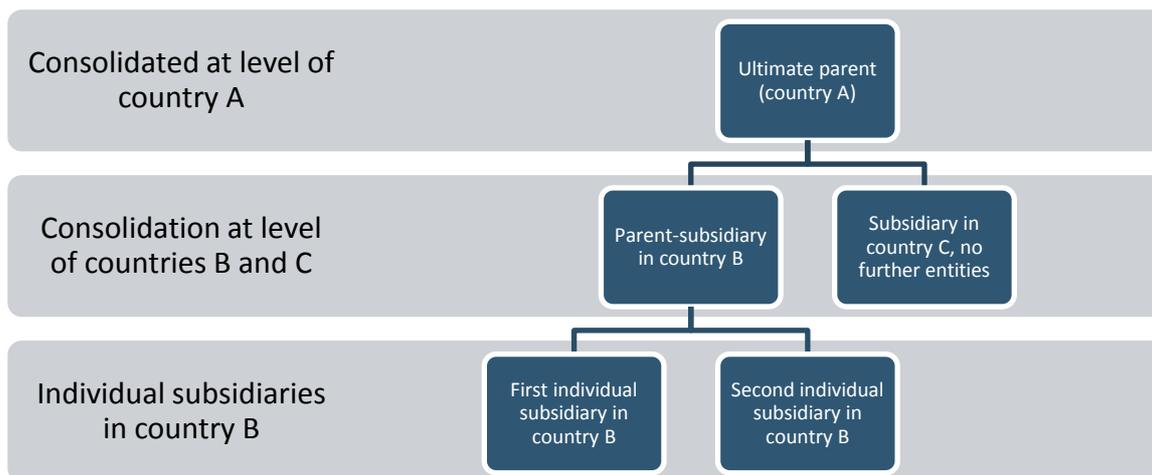

¹⁰ [Decision EBA/DC/2015/130](#)

¹¹ [List of reporting institutions to EBA](#)

liquidity reporting,¹² not only the ultimate parent in the EU should submit consolidated information but also the intermediate parent the institution may have in any other EU country.

Therefore, when aggregating this information across countries, it may lead to double counting, as the same group (activities of the consolidated group in a given country) are reported twice: (i) **within the ultimate consolidated group**, and (ii) **within the consolidated group at country level**. The stylised example, in Table 11 below, aims at illustrating this point.

Table 11: Consolidation levels

From the above example, the individual subsidiaries in country B are considered twice at the consolidated level, as they are part of the consolidated group reported in country B (itself a sub-consolidated level) and also of the ultimate consolidated group located in country A.

When the information for countries A and B is aggregated for the EU, the EBA removes the double counting of the individual subsidiaries. In reality, the structure of most EU banks is far more complex than the one shown in Table 2, as there are many other layers and relationships across countries and, in some cases, more than one parent institution for a given country. Nonetheless, the example outlined above should raise awareness among users of supervisory data and the limitations this could bring to their analysis.

II.1.4. Data quality assurance procedures

Computing risk indicators requires a significant amount of good quality and reliable data. In this sense, conducting rigorous consistency and quality checks for all the building components of a risk indicator is of paramount importance. A failure to identify potential problems during the data collection phase may result in transmitting these errors to the individual risk indicators and thus hamper analysis, confusing or misleading potential users.

In order to ensure the data quality, a well-established framework of rules is desirable. To that end, the EBA, in cooperation with the other competent authorities, has established a well-defined

¹² According to the ITS on supervisory reporting, liquidity information shall only be submitted at the individual level and at the level of the ultimate parent institution in the EU.

data quality framework in order to ensure that the reported data is of adequate quality in the context of the EBA's ITS on supervisory reporting and when issues are spotted, there is a clear follow-up process.

In brief, the ITS data quality assurance framework relies on a two-step process. In the first place, ITS data submissions have to conform to a set of validation rules. Usually, these are linear checks that ensure the consistency of the reported data. For example, a typical validation rule will check whether reported subtotals add up to the figure reported as the total for a particular economic concept. The failure to meet validation will either block the relevant data submission or trigger a warning message for the reporter. Most of these validation rules are embedded in the XBRL taxonomies, which are not necessarily mandatory for institutions reporting to national competent authorities (NCAs); however, they are mandatory for secondary reporting, i.e. for competent authorities (i.e. the ECB and NCAs not under the SSM) when reporting to the EBA.

In the second stage, a new set of tests are performed by the EBA competent authorities. In fact, the EBA – together with the competent authorities – is in charge of conducting completeness checks to ensure that the expected number of items has been submitted in a timely and complete manner, and other quality and plausibility checks to ensure that the reported items do not contain any outliers or implausible values. In the event that a discrepancy is identified, reporting institutions will be contacted and requested to review the values or justify them.

II.2 Negative values in numerators and denominators of ratios

From a mathematical perspective, the numerators and denominators of certain ratios are constructed in such a way that they can show both positive and negative values. This is particularly common for ratios that include net income items, which obviously are more prone to different business cycles and increased volatility. Therefore, the possible combinations in a ratio where positive or negative signs could get involved are illustrated as follows.

Table 12: Possible sign combinations in a ratio

Numerator	Denominator	Ratio
Positive	Positive	Positive
Positive	Negative	Negative
Negative	Positive	Negative
Negative	Negative	Positive

While the first three combinations do not pose any methodological issues, the fourth combination, i.e. both a negative numerator and denominator, will produce a positive indicator that could be potentially quite misleading (see Box 2 for a stylised, illustrative example).

Indeed, ignoring this issue could lead to seriously misleading results. For example, in those cases where the reporting institution is precisely performing worse (with both variables in the indicator taking negative values), the calculated value of the ratio would place it together with 'normal performers', i.e. those with positive values, potentially even amongst the best performers across the sample of institutions.

With the above in mind, three alternative actions can be considered:

- **Dropping out the reporting institutions for which both numerators and denominators are negative from computing ratios.** While this alternative would ensure that positive values of KRIs actually reflect positive performance of the underlying reporting institutions, this would hamper the analysis, as the sample would not contain all the reporting institutions, excluding, precisely, those that are probably in a weaker position and therefore deserving closer attention by microprudential and macroprudential supervisors. If these ratios are further aggregated by country, the effects of this choice would be amplified. In other words, **following this alternative would provide a partial and probably overly optimistic view;**
- **Compute the ratio by using absolute values.** This option would remove the impact that the signs of the numerator and denominator have on the signed value taken by the computed ratio. However, this is actually its main drawback, as the distinction between positive and negative values of the indicator is of the utmost relevance. The adoption of this alternative **would imply a relevant loss in the analytical value of the ratio itself, given that gains and losses would be treated equally;**
- **Artificially transforming the value of the ratios.** This solution would group those entities with a **negative numerator and denominator** together with those that only have one of them flagged as negative. The advantages of this approach are that the sample would remain the same and the users of the data would be assured that positive values certainly reflect positive performances. The only concern with the proposal is that it obliges one to adjust ex-post the values reported, a task which requires resources and manual intervention and may lead to man-made errors.

In summary, the **third option seems to be the most appropriate**. The first option, which is followed by the EBA, can also be pursued by allocating a -100% to the ratio or by setting the value of the ratio to be the minimum of the sample considered. These two solutions, though, imply that the amended data would not show any direct relationship with what the relevant institution has reported,¹³ so they are less preferable in that sense.

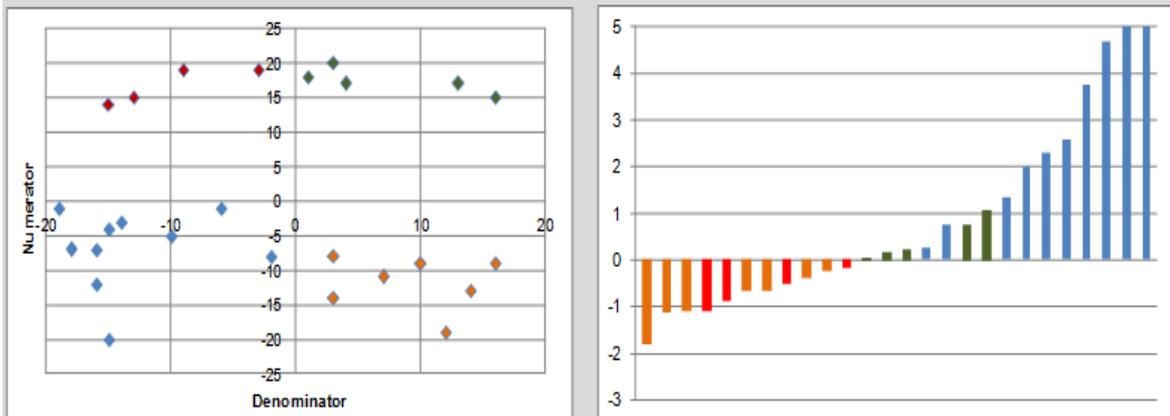

¹³ The allocation of the -100% or the minimum amount in the sample could seem arbitrary and may impair the analytical power of the indicator. In these cases, even small and minor negative amounts would give rise to classifying the reporting institution among the worst.

Box 2. An illustrative stylised example of the methodological concerns when numerators and denominators of a ratio take positive and negative values.

In order to illustrate the discussion in this section, it may be useful to look at a stylised example to better understand the effect that negative numerators and denominators in a ratio can have when analysing the information.

Let us suppose the following values of the numerators and denominators of a ratio (Figure 1) on a sample of reporting institutions. Green values show positive values for numerator and denominator, which would generate a positive ratio. In the case of red and orange values, the ratio would have a negative sign, as they have either the numerator or the denominator with negative sign. Finally, those items in blue would have a positive ratio from having a negative numerator and denominator. The values of these ratios are sorted in Figure 2.

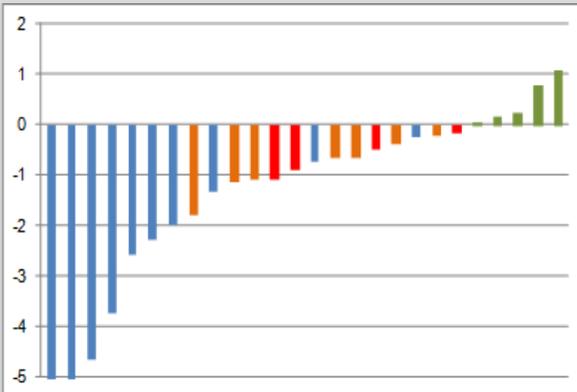

Figure 1: Plotted values of numerators and denominators **Figure 2: Sorted values of the resulted ratios**

In this case, those data points with negative numerators and denominators are the ones placed in the top positions of the ratio. If we translate this situation to a ratio which, for example, has as numerators and denominators net gains or losses, these institutions would be perceived as the ‘best performers’, while the reality is that they are the ‘worst performers’. Therefore, it is necessary to ex-post work on the calculated values of these ratios to avoid this kind of issue, as it may have negative consequences for our analysis.

The most suitable option would be to change the sign of those ratios with the negative numerator and denominator into negative, in order to not have positive ratios that could provide the wrong picture. If that is implemented in our stylised example, the results would be as in Figure 3.

Figure 3: Values of hypothetical ratios with artificial changes in the sign

For illustration purposes, Figures 4 and 5 depict how the different values of the risk indicators would look in this example if the alternatives of allocating the minimum value and -100% to those ratios with a negative numerator and denominator were adopted. As can be observed, such solutions would entail a significant loss of analytical power of the values reported.

Figure 4: Values of hypothetical ratios with allocation to the minimum value

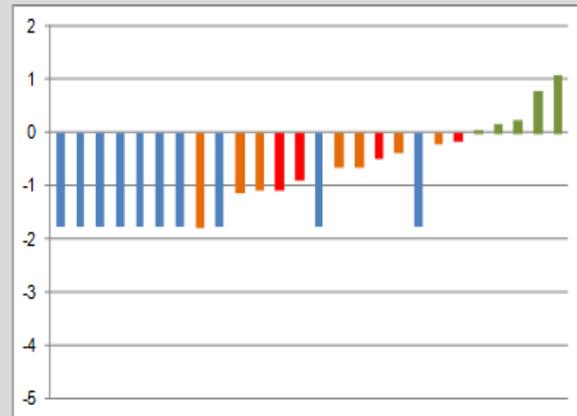

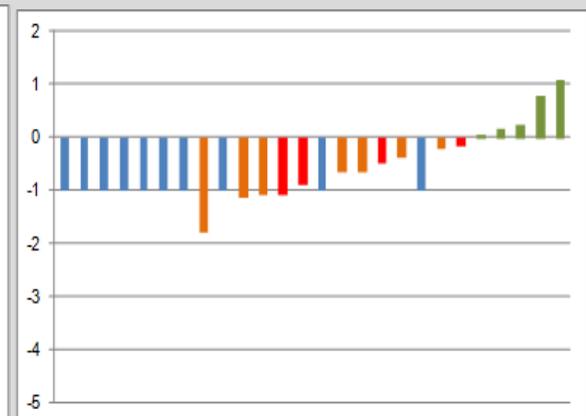

Figure 5: Values of hypothetical ratios with allocation to -100%

II.3 Using statistical measures (averages, percentiles, and standard deviations)

The indicators presented are commonly published and used in an aggregated form. In other words, they do not cover just one institution but several of them – for example, those used in the context of the EBA Risk Dashboard. However, different types of aggregation can be carried out, such as by country, by size or by nature of the underlying reporting institutions, and others. In all these cases, the analytical power of a given indicator is not fully applied if only one observation is used from the relevant sample, whether this is an average, median or a weighted average.

The simply use of averages may hide potential outliers. In particular, from a prudential point of view, the interest is not often on the average of the institutions included in the sample, but on the possible outliers which may exist. In a similar vein, simple averages do not take into account the relative importance of institutions; for instance, in the specific case of a sample composed of banks of different sizes, the smallest bank may have the same weight in the determination of the average than the largest bank in the sample. Thus, it is necessary to complement the value of the indicator with additional statistical measures that may provide additional information. The following paragraphs aim at describing, in brief, some of the most common statistical measures.

A first option is to use weighted averages. The use of weighted averages aims at considering the relative weight of each individual institution in the sample in the calculation of the value of a certain indicator. The relative weight is calculated by referencing an external variable (e.g. total assets), which is expected to provide a solid estimation of the weight of each institution in the sample. Therefore, with the use of weighted averages, larger institutions count more than smaller institutions and the final value of the indicator may have a bias towards this set of institutions, hiding those smaller institutions from view. This is illustrated in the theoretical example below, where larger institutions take the lowest values.

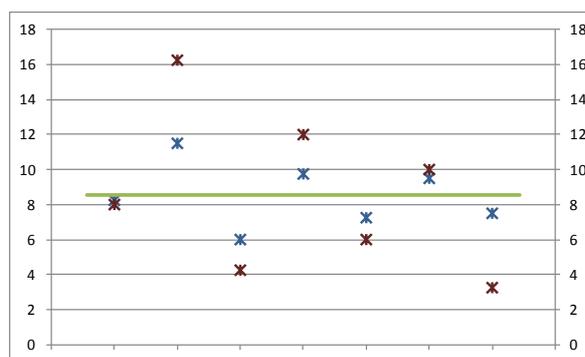

Table 13: Signs in the calculation of growth rates between two different values

Value of indicator	External variable
8.25	90
11.50	70
6	140
9.75	45
7.25	80
9.5	60
7.5	110
Simple average:	8.54
Weighted average:	8.07

Weighted averages are always used in the context of the EBA risk indicators' aggregates.

This analysis can be enriched by using dispersion measures. With regard to the dispersion of values of an indicator, as selected by each reporting institution in the sample, the most basic statistical measure used is the standard deviation - which measures the distance from the observation of a given institution to the average. **Low values** of the standard deviation point to a **concentration around the average**, whereas **high values** of the standard deviation indicate a **wide range** of values (see, for example, Chart 6 below, where the standard deviation of the red dots would be higher than that of the blue dots, while both have the same average). In that sense, it must be noted that the standard deviation does not provide any further information on how the individual observations are placed in relation to the average, so that values above and below the average are treated the same.

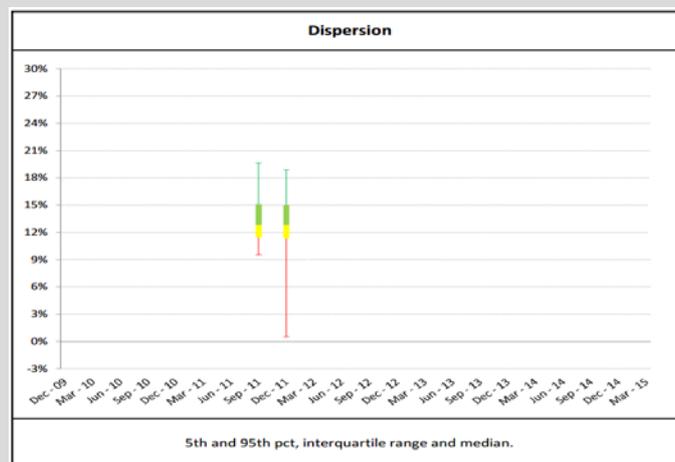

Figure 6: Relative positions of values in relation to the sample's standard deviation

To overcome this limitation, it is possible to use percentiles. This measure allows the users to better understand the range of values taken by the individual reporting institutions. The percentile X represents the value that takes the observation that represent up to X of the total sample. For example, the percentile 10 represents the value of the indicator taken by the individual observation that includes 10% of the sample. The most common percentiles used are the quartiles (25%, 50% and 75%). Maximum and minimum amounts are widely used as well. Applying percentiles helps the user to recognize the concentration of values taken by a given indicator and the potential existence of outliers. For example, if the third quartile is situated very far from the average, it may indicate that most of the values across the distribution for a particular indicator are above the average and that there are a reduced number of observations well below the average that determine the final value of the average.

Chart 7 depicts the quartiles of two series, and it can be observed how the second series has a wider interquartile range than the first.

Figure 7: Comparison of the interquartile ranges from two hypothetical samples

Source: The EBA risk dashboard

The 50% percentile, i.e. the median, represents the value that cuts the sample into two halves, one with values above the median and the second with values below. If we continue with our example in the previous paragraphs, the previous two series have an average of 8.54, whereas they have a median of 8.25 and 8 respectively. That broadly indicates that both series have more observations under the average than above the average, but the latter observations are more distant from the average value than the former.

Finally, in a different domain, a statistical measure that may be used for assessing concentration is the Herfindahl index. This index is primarily used to assess the competition and concentration in a given industry by looking at the relative importance of the firms involved. If 'S' represents the market share of each firm in the industry, expressed as a percentage, the Herfindahl index can be calculated as follows:

$$H = \sum_{i=1}^N S_i^2$$

Here, N is the number of firms in the industry. Increases in the Herfindahl index generally indicate a decrease in competition (increase in concentration), whereas decreases indicate a reduction in concentration (i.e. a competitive industry with no dominant players). When 'S' is expressed as a percentage (e.g. 0.1), the Herfindahl index ranges from 1/N to 1.

In order to transform the Herfindahl index to a range between [0,1], the normalised Herfindahl index (H^*) is introduced, which can be calculated as follows:

$$H^* = \frac{(H - 1/N)}{1 - 1/N}$$

Here, H is the Herfindahl index as calculated above. It is rather straightforward to extend the use of the Herfindahl index to other fields, especially to the area of concentration risk. For example, in

the case of exposures in different countries, the Herfindahl index can be used to assess whether the exposures of a certain institution are concentrated to a reduced number of countries or not. It can also provide interesting comparative information for those banks more active on a cross-national basis.

For example, let us assume the following exposures of three reporting institutions towards a small set of countries.

Table 14: Herfindahl indices

	Reporting institution X		Reporting institution Y		Reporting institution Z	
	Exposure	[0,1]	Exposure	[0,1]	Exposure	[0,1]
Country A	50	0.5	5	0.05	80	0.8
Country B	10	0.1	20	0.2	20	0.2
Country C	5	0.05		0		0
Country D	25	0.25	25	0.25		0
Country E		0	20	0.2		0
Country F	10	0.1	30	0.3		0
Total exposures	100	1	100	1	100	1
Normalised Herfindahl index	0.202 (20.2%)		0.082 (8.2%)		0.616 (61.6%)	

The Herfindahl index of the third reporting institution is significantly higher than the other two, as it concentrates its activities in only two countries. Similarly, the second reporting institution has the lowest value of the index, as its exposures appear to be more diversified among the countries.

In addition to the measurement of concentration of exposures in certain countries, the Herfindahl index can be used in other areas within the ITS on supervisory reporting, such as concentration of exposures across exposure classes, sectors of the counterpart and currencies.

II.4 Reporting by currency in the ITS liquidity templates

The framework for the reporting of **liquidity templates** (LCR, NSFR) is defined in Article 415 of the CRR, Articles 15 and 16 of the ITS on supervisory reporting, and Annexes XII and XIII of the latter.

In accordance with Article 415(2) (a and b) of the Regulation (EU) No 575/2013 (CRR), an institution shall separately report items in Article 415(1) to the competent authorities when it has aggregate liabilities in a currency different from the reporting currency (under paragraph 1) amounting to or exceeding 5% of the institution's or the single liquidity subgroup's total liabilities or a significant branch in accordance with Article 51 of Directive 2013/36/EU in a host Member State. In other words, institutions shall report separately for all significant currencies. In practice, this implies that the reporting template must be filled separately for each significant currency.

However, the liquidity report misses some relevant pieces of information. For instance, what is missed in the current reporting requirements for liquidity is the reporting of positions in the

reporting currency, which should be part of the requirements not only for the sake of completeness, but also for analytical reasons. Therefore, any analysis by currency of the liquidity risk of a given institution would miss precisely the most relevant currency: **the reporting currency**.

The only data available in the reporting currency already incorporates all other significant currencies. In fact, the reporting currency already incorporates all other significant currencies, which, in the case of large cross-border institutions, is expected to be important in absolute terms. Analogously, any analysis by currency that is based on aggregated data (for example, liquidity risks from USD positions by EU banks) will not be complete, as it would exclude those cases where the currency is a reporting currency of an institution that also reports other significant currencies.

The existence of reporting thresholds also hampers data analysis. Similarly to other parts of the ITS on supervisory reporting, where there are thresholds, the introduction of the **5% threshold in the definition of significant currencies** must be considered when carrying out any analysis of the data. Any analysis by currency shall be aware of the fact that when that currency is not significant for a number of banks, it is not reported. In other words, information on a given currency is only reported when it reaches the minimum threshold for it to be considered as significant.

This approach excludes positions of marginal importance, for the bank's balance sheet, but also has the potential to trigger adverse consequences. These risks are mainly related to the evolution of exchange rates, high risk of assets or liabilities held in that currency. To sum up, the reporting threshold prevents a full coverage of each currency to be reported, a fact that, in some extreme cases, may lead to the omission of some important facts (for example, many institutions with small but risky exposures towards a given currency).

11.5 The use of flow data in risk indicators – what is really meant by this?

The use of flows, instead of positions, may create challenges when calculating the risk indicators and in the subsequent analysis of the results. For many risk indicators, it is common that the numerator, the denominator or both express a concept that extends over a period of time (flow), rather than the static situation of an item at a point in time (stock). In such cases, and especially when the underlying data is submitted with a higher frequency than annually, the question that may arise is which period of time is this flow intended to cover. In other words, when an indicator is referring to flows over a period, it is not clear when that period starts and how the underlying data should be computed.

Financial indicators are especially affected by this time dimension. For instance, when computing the 'Return on Equity' (RoE), defined as the ratio between the net profit of the period and the equity of the reporting institution, the net profit covers cumulative net profit during the financial year. This results in different calculation periods for each reference date according to the methodology

used for its collection. In fact, this is particularly the case for financial reporting, whereas other prudential reporting often requires non-cumulative flows for each quarter of the calendar year.

For the calculation of such indicators EBA uses the extrapolation approach. This methodology has some drawbacks such as the assumption that the information behaves consistently and that it can be extrapolated for the whole year, and that negative values could potentially increase the forecast error in extrapolating flows based solely on one or two quarters. Nevertheless, this methodology seems to be the most appropriate in the field of supervisory reporting and returns the most coherent results for various analyses.

In order to replicate this approach, the amounts for each quarter are extrapolated on a year-to-date (YTD) basis, over a period covering 12 months. This means that, on an YTD basis, amounts for Q1 would be multiplied by four, the second quarter by two, and the third quarter by four thirds. The main drawback of this option, as mentioned, is that from a methodological standpoint, it assumes the information behaves consistently across all quarters of the year and that it can be extrapolated for the entire year. While this can be the case for the YTD data of the third quarter, which covers 9 of the 12 months of the year, this assumption becomes more dubious for the data in the first quarter, which only covers 3 months, and which may give an estimated value for the whole year that is quite far from the real observed one 9 months later. Furthermore, negative values (i.e. a net loss) could potentially increase the forecast error in extrapolating flows based on one or two quarters.

Box I – Other alternative approaches to calculate indicators using flow data

There are obviously other three alternatives to calculate indicators based on flow information. The next paragraphs describe other acceptable methodologies that can be adopted, when underlying information is reported on a quarterly basis.

1. Only use the amounts of the quarter. For this case, the flow information for quarterly reported data would cover 3 months, irrespective of whether it is the first, second, third or fourth quarter of the year. Despite the consistency this solution introduces in the indicators' compilation, as all the quarters would contain amounts purely generated during 3 months. One possible reason for this stems from the fact that some important charges in the profit or loss account (where all the items are reported as accumulated flows) are made in the last quarter of the year; therefore, under this approach, indicators for the fourth quarter would depart from the values reported in the previous quarters, showing a strong seasonality over the years. Calculating flow-based indicators for each quarter would be justified when analysis is focusing on the latest trends or on the activities during a quarter – for example, when analysing an individual bank's trading income or impairments.

2. Consider the last four quarters (moving year). In this case, the natural year is not followed and all the observations cover the period of the last 12 months. That would mean, for example, that for Q1, data from Q2, Q3 and Q4 of the previous year would also be considered. Such a solution ensures consistency across observations, as all of them would cover periods of the same length (12 months), and it would avoid the seasonality of the previous alternative. Nonetheless, although sound from a methodological point of view, this option implies that the link between the natural and the accounting (which often coincides with the natural) year is broken, so it is not very widely used in

the domain of supervisory statistics. This approach would be preferred for sector-wide computations, where it is important to have comparable data.

3. Compute the data on a year-to-date (YTD) basis. This is the solution adopted in the ITS on supervisory financial reporting (see Article 2(2)) and reinforced by Q&A 126 and 619, in which FINREP is concerned. In this case, data of the first quarter would cover 3 months, data of the second quarter 6 months, data of the third quarter 9 months and data of the fourth quarter 12 months. At the end of the natural year, in the period covering 12 months, the counter would start again and the first quarter would cover 3 months and so on. In spite of the inconsistency in the duration of the period covered by the flows, this alternative is widely used in supervisory reporting.

In the following, the example of the RoE demonstrates the key differences of these four alternatives.

Table 15: RoE ratio based on different flow measures

	Q1	Q2	Q3	Q4
Net profit for the period				
1. Extrapolation of YTD	$Q1 \times 4$	$(Q1 + Q2) \times 2$	$(Q1 + Q2 + Q3) \times \frac{4}{3}$	$Q4 + Q3 + Q2 + Q1$
2. Amounts generated in the quarter	Q1	Q2	Q3	Q4
3. Last four quarters (moving year)	$Q1 + Q4_{t-1} + Q3_{t-1} + Q2_{t-1}$	$Q2 + Q1 + Q4_{t-1} + Q3_{t-1}$	$Q3 + Q2 + Q1 + Q4_{t-1}$	$Q4 + Q3 + Q2 + Q1$
4. YTD basis	Q1	$Q2 + Q1$	$Q3 + Q2 + Q1$	$Q4 + Q3 + Q2 + Q1$
Equity	As of 31 March	As of 30 June	As of 30 September	As of 31 December

Assuming a net profit in each quarter of 200, 150, 250 and 50 (and 200, 150 and 50 for the second, third and fourth quarters of the previous year), and a total equity of 1 000 constant during the year, the return of equity according to the four alternatives would take the following values.

Table 16: Numerical representation of table

	Q1	Q2	Q3	Q4
Net profit for the period				
1. Extrapolation of YTD	$200 \times 4 = 800$	$(200 + 150) \times 2 = 700$	$(200 + 150 + 250) \times \frac{4}{3} = 800$	$50 + 250 + 150 + 200 = 650$
2. Amounts generated in the quarter	200	150	250	50
3. Last four quarters (moving year)	$200 + 50 + 150 + 200 = 600$	$150 + 200 + 50 + 150 = 550$	$250 + 150 + 200 + 50 = 650$	$50 + 250 + 150 + 200 = 650$
4. YTD basis	200	$150 + 200 = 350$	$250 + 150 + 200 = 600$	$50 + 250 + 150 + 200 = 650$
Equity	1 000	1 000	1 000	1 000

RoE				
1. Extrapolation of YTD	0.80	0.70	0.80	0.65
2. Amounts generated in the quarter	0.20	0.15	0.25	0.05
3. Last four quarters (moving year)	0.60	0.55	0.65	0.65
4. YTD basis	0.20	0.35	0.60	0.65

From this basic numerical example, it can be seen how the method considering only amounts generated in the quarter produces indicator values much lower than those generated by the other three methodologies, as the other approaches cover a period of 12 months. It is also worth noting how the moving year, the YTD basis and the extrapolation of YTD converge to the same value at the end of the fourth quarter, but following a different path in the previous quarters. While the calculation of the “last four quarters in a moving year” provides the most stable range of values, the incremental component embedded in the YTD basis is clearly seen, as is the highest volatility in the values taken when extrapolating the YTD data to the full natural year.

Finally, besides the need to annualise the flow data to estimate the numerator, one also needs to normalize the denominator. Due to their volatility, many financial indicators are also adjusted using an average value between two periods. This is the case for the RoE, where the denominator (Equity) should be calculated as an average between the last year-end period and the current quarter. For instance, to estimate the RoE for a second quarter the following formula applies:

$$(1) \quad RoE_{Q2,Year_t} = \frac{(Profit\ or\ loss_{Q1,Year_t} + Profit\ or\ loss_{Q2,Year_t}) \times 2}{(Total\ equity_{Q4,Year_{t-1}} + Total\ equity_{Q2,Year_t}) / 2}$$

It is understood, that all methodologies have advantages and disadvantages in calculating the indicators. The decision of which methodology should be used therefore depends on the purpose of the analysis, and it should take into account which indicator is being considered. The stylised example used in this section has outlined how the choice between the four calculation methods can have an important impact on the values serving as input to the indicator under analysis; in a way, it shows that the analysis itself may change depending on which alternative is finally taken. The use of YTD data, also when annualised to the full year, is the most suitable in the field of supervisory reporting, and thus the **one used by the EBA when computing relevant risk indicators.**

II.6 The ‘follow-the-money’ approach

The understanding of firms’ business models and the risk embedded is a key challenge for supervisory authorities¹⁴. A starting point is a detailed analysis of companies’ financial statements and reports to obtain a deeper understanding of the drivers of revenues and trends that are developing in the firm. Also, to determine whether these patterns are consistent with the firm’s stated risk appetite and are sustainable. This ‘follow-the-money’ approach enables supervisors to focus on the main businesses whose failure would cause problems for the firm; as compared to other business units whose failure could have no or little impact on the firm performance.

Nowadays, the most common practices focus their analysis in financial risks; however, this analysis can be extended to other possible causes of failure. All supervisory authorities focus on the main financial risks (such as credit, market, etc.) by improving their already existing models, but this in-depth analysis may lead to a lack of vision regarding the whole risk of the firm. On the other hand, supervisory authorities could have a clearer vision about the risk drivers embedded in the risk of the firm and could increase the effectiveness of their activity by directing their efforts towards the specific area whose failure might cause problems for the company. This ‘follow-the-money’ proposal starts from a very common financial formula – return on equity (RoE) – in order to understand the drivers of revenues and to determine where the relevant risks are.

The starting point to assess the firm’s business model and the risk embedded in it is the RoE formula, which makes clear the main sources of capital yield:

$$\text{RoE} = \text{NoP}/\text{Asset} \times \text{Asset}/\text{Equity} \times \text{EbT}/\text{NoP} \times \text{NP}/\text{EbT}$$

Here

$$\begin{aligned} \text{NoP} / \text{Asset} &= \text{Net operating profit/Total leverage ratio exposures} = \\ &= \text{Net asset yield contribution} \end{aligned}$$

$$\begin{aligned} \text{Asset}/\text{Equity} &= \text{Total leverage ratio exposures/T1 capital} = \\ &= \text{1/Leverage contribution} \end{aligned}$$

$$\begin{aligned} \text{EbT}/\text{NoP} &= \text{Profit or loss before tax/Net operating profit} = \\ &= \text{Non-operating incomes or expenses contribution} \end{aligned}$$

$$\begin{aligned} \text{NP}/\text{EbT} &= \text{Net profit/Profit or (-) loss before tax} = \\ &= \text{Tax effect on the capital yield} = \\ &= \text{1 – Tax rate} \end{aligned}$$

¹⁴ See also: http://www.financialstabilityboard.org/publications/r_101101.pdf.

According to this formula, one can assume that the results of the bank's business model is based on internal factors that are managed by the firm, such as **asset** and financial structure, or on **external factors not managed** by the firm and which may depend on one-time factors that are unlikely to occur in the future, or contingent on factors such as **fiscal policy**. Obviously, the main part of the capital yield should be the asset yield contribution but, in financial intermediaries, leverage is often a key driver of capital yield.

This approach enables us to analyse the return on investment. More important, these indicators can be broken down in information available in the report and therefore combining different pieces of information to understand the main drivers of the business models risks. Before moving forward, it is worth recapping the abbreviations that will be used later in the discussion on the return on investment. Some of them have already been used for the analysis of RoE and are disclosed in Table 17 below.

Table 17: Building components of the RoE ratio

AdE	Administrative expenses	Loanb	Loan to banks
AdV	Added value = Operating income - Administrative cost (without staff expenses)	Loanp	Loan to private
BankB	Banking book	NetFop	Net financial other operations
Depb	Banking deposits	NetH	Net financial hedging
Depp	Private deposits	NetT	Net trading
EbT	Earnings before tax	NetTrP	Net trading profit
Equity	Own funds	NI	Net interest
FiA	Financial asset	NIF	Net interest and fee
FiAo	Financial other asset	NoP	Net operating profit
FiL	Financial liabilities	Opl	Operating income
InE	Interest expenses	OpP	Operating profit
InEb	Interest expense from bank	RWA	Risk-weighted asset
InEp	Interest expenses from private	RWAcR	Credit risk-weighted asset
InEs	Interest expenses from securities	RWAmr	Market risk-weighted asset
InIb	Interest income from banks	Sec	Securities
InIbb	Interest income from banking book	StaffE	Staff expenses
InIo	Interest income from other	TrB	Trading book
InIp	Interest income from private		

To that end, the firm's core business should be analysed using a step-by-step approach, taking the return on investment as the starting point.

First step:

$$RoI = OpP/Asset \times NoP/OpP$$

Here

$OpP / Asset$ = Asset performance

NoP / OpP = Weight of risk

Second step:

$$OpP / Asset = OpI / Asset \times OpP / OpI$$

Here

$OpI / Asset$ = Banking activity performance

OpP / OpI = Bank's efficiency level

Third step:

$$OpI / Asset = \frac{NI}{FiA} \times \frac{FiA}{Asset} \times NIF / NI \times OpI / NIF$$

Here

NI / FiA = Banking activity

$FiA / Asset$ = Share of financial asset of total asset

NIF / NI = Component fee

OpI / NIF = Trading performance

The third step shows the contribution of different banking business activities: banking, services and trading. In this case, the banking activity is proxied by the formula:

$$NI / FiA = InI / FiA - (InE / FiL \times FiL / FiA)$$

It could be useful to further analyse how this margin is determined. Below there are some examples of how this stream of analysis can be pursued more in depth.

Income analysis: contribution of different portfolios to the interest income.

$$\begin{aligned} InI / FiA \\ = (InIb / Loanb \times Loanb / FiA) + (InIp / Loanp \times Loanp / FiA) + (InIo / FiAo \\ \times FiAo / FiA) \end{aligned}$$

Funding analysis: the cost of different liabilities that are used for funding.

$$\begin{aligned} InE / FiL \\ = (InEb / Depb \times Depb / FiL) + (InEp / Depp \times Depp / FiL) + (InEs / Sec \times Sec / FiL) \end{aligned}$$

Trading performance analysis: the main drivers for the trading performance ($OpI | NIF$) are:

$NetT/OpI$ = Contribution of trading activity

$NetH/OpI$ = Contribution of hedging activity

$NetFop/OpI$ = Contribution of financial operations other than trading and hedging

After analysing the main sources of income, the analysis may continue with the second driver of the asset performance: the efficiency of the bank. The starting formula, taken from step 2 above, is: OpP/OpI

The level of bank efficiency mainly depends on two factors:

Structural efficiency $AdE/Asset$

Staff efficiency $StaffE/AdE$

Usually, the expense for the staff is a key element of the bank's costs, so it could be useful to verify the level of staff efficiency in the different funding bank's activities and performance.

Funding activities:

Deposits $Depp/N^{\circ} emp$

Securities $Sec/N^{\circ} emp$

Fund management $FM/N^{\circ} emp$

Performance:

Income $OpI/N^{\circ} emp$

Cost $AdE/N^{\circ} emp$

Value added $AdV/N^{\circ} emp$

In order to verify the bank's productivity, there are two indicators that can be used:

Staff unit cost $StaffE/N^{\circ} emp$

Profit per employee $OpP/N^{\circ} emp$

Furthermore, for the bank's core business, a risk-adjusted return analysis should be performed. At this stage, it is considered that the banking book reflects the bank's core business. The starting point for this analysis would be:

$$InIbb/BanB = InIbb/RWAcr \times RWAcr/BanB$$

Here

$InIbb/RWAcr$ = Risk-adjusted return on asset

$$RW_{Acr}/BanB = \text{Risk management effect}$$

A similar analysis can be carried out on the trading book:

$$NetTrP/TrB = NetTrP/RW_{Amr} \times RW_{Amr}/TrB$$

Here

$$NetTrP/RW_{Amr} = \text{Risk-adjusted return on asset}$$

$$RW_{Amr}/TrB = \text{Risk management effect}$$

Last but not least, banking activities typically rely heavily on leverage, which may be risky if used at an extreme level. According to the Basel and European CRR/CRD IV frameworks, the level of a bank's own funds is related to the RWA (or risk exposure amounts as in CRR/CRD IV terminology), so it could be useful to verify how much of the leverage depends on the management effect.

$$Asset/Equity = Asset/RWA \times RWA/Equity$$

Here

$$Asset/RWA = \text{Risk management effect}$$

$$RWA/Equity = \text{Leverage risk adjustments}$$

To sum up, the analysis hereby presented is based on the profit and loss account of a given institution, and aims at determining the main drivers therein. Among others, these drivers can derive from the core activities of the institution (banking book) or from its trading activities (trading book). In parallel, this approach pays special attention to the efficiency and productivity of an institution, a domain usually scarcely assessed. Therefore, in order to carry out this analysis, several indicators (as set out in Table 18 below) must be compiled. Out of this set, the main indicators (the first layer) are included under the PFTs section (I.4 of this Guide).

Table 18: Building components of the 'follow-the-money' approach

Number	Formula	Name
PFT 21	$NP/Equity$	Return on equity
PFT 17	$NoP/Asset$	Return on investments
PFT 18	$Asset/Equity$	Leverage
PFT 19	$EbIT/NoP$	Non-operating earnings
PFT 20	$NP/EbIT$	Tax effect
	$OpP/Asset$	Operating profit to total asset
	NoP/OpP	Net operating profit as % of operating profit
	$OpI/Asset$	Operating income to total asset
	OpP/OpI	Operating profit as % of operating income
	NI/FiA	Net interest to financial asset

	<i>FiA/Asset</i>	Financial asset as % of total asset
	<i>NIF/NI</i>	Net interest and fee as % of net interest
	<i>Opl/NIF</i>	Operating income to net interest and fee
	<i>InI/FiA</i>	Interest income to financial asset
	<i>InE/FiL</i>	Interest expenses to financial liabilities
	<i>FiL/FiA</i>	Financial liabilities to financial asset
	<i>INib/Loanb</i>	Interest income from credit institutions to credit institutions loan
	<i>Loanb/FiA</i>	Credit institutions loan as % of total financial asset
	<i>InIp/Loanp</i>	Interest income from corporate to corporate loan
	<i>Loanp/FiA</i>	Corporate loan as % of total financial asset
	<i>InIo/FiAo</i>	Interest income from other to other loan
	<i>FiAo/FiA</i>	Other financial asset as % of total financial asset
	<i>InE/FiL</i>	Interest expenses to financial liabilities
	<i>InEb/Depb</i>	Banking interest expenses to banking deposit
	<i>Depb/FiL</i>	Banking deposit as % of total financial asset
	<i>InEp/Depp</i>	Corporate interest expenses to corporate deposit
	<i>Depp/FiL</i>	Corporate deposit as % of total financial asset
	<i>InEs/Sec</i>	Securities' interest expenses
	<i>Sec/FiL</i>	Securities as % of total financial asset
	<i>NetT/Opl</i>	Net trading as % of operating income
	<i>NetH/Opl</i>	Net hedging as % of operating income
	<i>NetFop/Opl</i>	Net other financial operations as % of operating income
	<i>AdE/Asset</i>	Administrative expenses to total asset
PFT 1	<i>StaffE/AdE</i>	Staff expenses as % of total administrative expenses
	<i>Depp/N° emp</i>	Corporate deposit to number of employees
	<i>Sec/N° emp</i>	Securities to number of employees
	<i>FM/N° emp</i>	Fund management to number of employees
	<i>Opl/N° emp</i>	Operating income to number of employees
	<i>AdE/N° emp</i>	Administrative expenses to number of employees
	<i>Adv/N° emp</i>	Added value to number of employees
	<i>StaffE/N° emp</i>	Total staff expenses to number of employees

$OpP/N^{\circ} emp$	Operating profit to number of employees
$InIbb/BanB$	Interest income from banking book to banking book
$InIbb/RWAcR$	Interest income from banking book to credit risk-weighted asset
$RWAcR/BanB$	Credit risk-weighted asset to banking book
$NetTrP/TrB$	Net trading profit to trading book
$NetTrP/RWAmr$	Net trading profit to market risk-weighted asset
$RWAmr/TrB$	Market risk-weighted asset
$Asset/RWA$	Total asset to risk-weighted asset
$RWA/Equity$	Risk-weighted asset to equity

II.7 Peer group analysis

In line with the discussion in previous sections II.1 and II.2, the risk indicators presented in this Guide may be used over an aggregation of reporting institutions. At this point, how reporting institutions are combined together becomes important and it is where the concept of the ‘peer group’ arises.

Peer group analysis (PGA) can be defined as the process of comparing an institution to its peers (peer group). A peer group is a set of entities that share **similar characteristics** on the basis of analytically relevant criteria. PGA has been used to compare the performance or positioning of an institution to its competitors, for investment selection, stock valuation, fraud detection, executive compensation, clustering analysis, and so on.

PGA can also be extended to assess how a particular strategy or change in market conditions might affect the position of an institution compared to its peers, which is known as peer group risk (PGR). Ultimately, this means introducing sensitivity analysis to PGA. In either PGA or PGR, the introduction of the temporal dimension adds more power and insight to the analysis.

The definition of ‘peer group’ depends on the purpose of the study, and will have an important impact on the analysis performed. Once the objective of the study is clear, a target set of dimensions can be chosen to slice and dice the data to select the peers, and the wide variety of risk indicators within each group can be used to compare a specific institution to the group or the group to population averages.

A wide variety of peer groups can be created by combining different data dimensions, and descriptive statistics can be calculated to examine the dispersion and concentration of institutions within the group. The creation of customised peer groups and PGA can be greatly facilitated by data available in a flexible IT infrastructure, one which could allow users to slice and dice data across several dimensions and automatically generate statistics and trend analysis. In this context, the facts (risk indicators) could potentially become dimensions, generally after a bucketing on the risk indicator has been performed. Though the main data source would be risk indicators generated from regulatory returns, the addition of external information, either available internally to Competent Authorities or from market sources, would only enrich the analysis and extracted insights.

There are several methodologies for choosing peers, some of which are:

1. **Data model:** this method compares the mean, median and variance (as well as potentially other statistical measures) of each variable for potential groups. The peer group’s mean and median for the different risk indicators would ideally be close to the target institution’s values and the variation close to zero;

2. **Cluster analysis:** it is a statistical technique that identifies entities sharing similar features in a multidimensional environment by minimising a measure of distance among the risk indicators evaluated;
3. **Threshold approach:** it uses thresholds on data to narrow the population and find a set of peers. Thresholds are usually selected arbitrarily and can consist of a set of rules rather than a single value point;
4. **User defined:** the user directly decides the peers to whom they will be compared.

The number of peers within a group required to provide a meaningful analysis varies from author to author, some stating that groups should be comprised of 10-12 members while others limiting the size to 10-30. Ultimately, the size of the group would depend on the objective of the PGA and the available dimensions in the dataset to generate groups of similar characteristics.

Once the groups have been defined, we can start comparing the different risk metrics within the group and across groups. It is common to use intragroup (e.g. top 5-10 average or best in class) or population averages to compare the different institutions and to look at the evolution of measures over time. Averages here may mean weighted averages, trimmed averages (where x% of the top and bottom observations have been removed) or a combination of both. By comparing the evolution of these indicators, it may be possible to identify outliers in the group, diverging/converging trends that can indicate changes in the risk profile of the entity within the group, and even transitions to other groups. All these signs are worthy of investigation.

Risk metrics or performance metrics would correspond to the list of risk indicators, calculated at the appropriate aggregation level determined by the dimensions used to generate the peer groups. Thus, for example, it is not the same to aggregate values at a country level as to aggregate the input values and then calculate the indicator, the latter being preferred to the former. When a risk indicator is used as a dimension, it generally loses its relevance as a risk measure.

Some useful dimensions that could be used to create peer groups are:

- **Asset size:** this variable has extensively been used to define the systemic importance of an institution and its impact on the local economy. Though not the only variable used, we could reuse here the readily available classifications of systemically important financial institutions or any other classification elaborated;
- **Business lines:** retail (deposit-taking) banks, commercial banks, and mortgage banks;
- **Type of ownership:** public-government controlled entities, privately owned banks, and bailed-out entities;
- **Country and currency dimensions;**
- **Portfolio:** residential Buy to let (BTL), Credit Risk Exposures, Standardised Approach (SA), Internal ratings-based (IRB), credit cards, car loans, loan and advances, debt securities, securitisations, and so on;

- **External ratings:** in this category, we can also consider the impact and probability risk ratings to be developed by the ECB in combination with traditional ratings from Standard & Poors, Fitch and Moody's;
- **Strategy:** although a more difficult topic to classify, institutions could be classified depending on their business strategy or business model. As this is generally focused on the asset side, attention should also be given to the liability side in terms of their funding strategies.

Clearly, this is not an exhaustive list, but it helps to understand the concept of a dimension.

An issue that one should be aware of is the level of aggregation at which the PGA is conducted. Analysis on an individual institutional level provides more granularities and a better understanding of the evolution and differences with peers, especially if the user has knowledge on the entities from some sort of supervisory engagement. However, this provides information on specific institutions and confidentiality limitations may apply. In these situations, aggregation of the data is required to ensure that individual information cannot be derived from the information available, and the outputs are suitable for external publication.

Although PGA is a useful tool that is widely used in business and finance, it is not free of risks and limitations that the user should be aware of:

1. Compare like with like: the main objective when defining peer groups is to ensure that participants in each group are approximately similar so that we can compare like with like. This may be a difficult task as peer selection may change depending on the dimensions or methodology used, and it is not always clear what is the right set of dimensions (and hierarchy) and some of these can be difficult to identify or measure. Because of the difficulty to identify or measure, strategies, business models or investment objectives are usually not taken into account when selecting groups, leading to poor peer selections;
2. Poor metric definitions: if the metrics are not well defined, there might be inconsistencies in the calculation and uncertainty from the analyst on how to interpret the data. As the new set of risk indicators is well defined based on the XBRL taxonomy, this risk is minimal in our context;
3. Annualising data: this may falsely represent performance, especially when institutions realise a one-time or seasonal source of income that will not reoccur over time;
4. Survivorship bias: this happens when institutions close their business or merge and, therefore, are no longer in the universe of entities. As the surviving institutions may present better performance results or be bigger in size, averages may be upwardly biased. The composition of the universe is also affected by institutions coming in and out of the reporting requirements as they fulfil or fail to fulfil the conditions to be in the sample;
5. Singular benchmark for decision-making: when PGA is used in decision-making, actions based on what peers have done rather than on an institution's own merits may lead to wrong decisions. In addition, this could lead to a bias for the status quo, as the entity may lean towards avoiding changes to stay similar to its peers. It is also important to understand the underlying reasons for the trends or performance changes we see in the PGA, and why they have been better or worse. Similar strategies in different institutions do not necessarily

produce the same outputs and it is important to understand the reasons why they worked or did not work before implementing them for another entity within the group. Furthermore, it is relevant to notice that data aggregation would make it more difficult to gain insights over the underlying reasons of an issue or the problem may pass unnoticed after the aggregation;

6. Materiality: it is difficult to estimate the threshold beyond which divergences from the institution's peers become an issue too big to ignore and below which they are movements from the normal course of business.

ANNEX I.

Risk indicators

Number	Name	Formula	Frequency	Description	Range of values	Data Point A				Data Point B				Data Point C				Data Point D			
						Template	Sheet	Row	Column	Template	Sheet	Row	Column	Template	Sheet	Row	Column	Template	Sheet	Row	Column
Liquidity																					
LIQ_1	Core funding ratio (% of total liabilities) – 'Turner ratio'	Liabilities providing stable funding (A + B) / Total liabilities and own funds (C)	Quarterly	An alternative measure of stable sources of funding as a proportion of total liabilities and own funds	[0,1]	C 61.00	Total	(040-250)	(010-050)	C 61.00	Total	010-020	050	F 01.03		310	010				
LIQ_2	Short-term wholesale funding Ratio (% of items providing stable funding)	Short-term liabilities from customers that are not financial customers + Short-term liabilities from customers that are financial customers (A) / Total items providing stable funding (B + C)	Quarterly	Indicates institutions' relative reliance on short-term wholesale funding	[0,1]	C 61.00	Total	(070-200)	(010-040)	C 61.00	Total	(040-250)	(010-050)	C 61.00	Total	(010-020)	050				
LIQ_5	Withdrawable funding (% of total liabilities)	Withdrawable retail deposits + Withdrawable liabilities from customers that are not financial customers + Withdrawable liabilities from customers that are financial customers (A) / Total items providing stable funding (B + C)	Quarterly	Gives the proportion of institutions' liabilities that are sight deposits (i.e. of open maturity, that are readily withdrawable) or funding that will mature within 3 months	[0,1]	C 61.00	Total	(040-200)	010	C 61.00	Total	(040-250)	(010-050)	C 61.00	Total	(010-020)	050				
LIQ_6	Term funding (% of total liabilities)	Term retail deposits + Term liabilities from customers that are not financial customers + Term liabilities from customers that are financial customers (A) / Total items providing stable funding (B + C)	Quarterly	Gives the proportion of institutions' liabilities that are considered term funding of fixed maturity > 3 months.	[0,1]	C 61.00	Total	(040-200)	(020-050)	C 61.00	Total	(040-250)	(010-050)	C 61.00	Total	(010-020)	050				
LIQ_8	Repos funding Ratio (% of items providing stable funding)	Repurchase agreements held for trading (A) / Total items providing stable funding (B + C)	Quarterly	Indicates institutions' relative reliance on repos for funding	[0,1]	F 08.01		100, 150, 200, 250, 300, 350	010	C 61.00		(040-250)	(010-050)	C 61.00	Total	(010-020)	050				
LIQ_9	Funding via derivatives (% of total items providing stable funding)	Liabilities from derivative payable contracts (A) / Total items providing stable funding (B + C)	Quarterly	Indicates institutions' relative reliance on derivatives as a source of funding	[0,1]	C 61.00		240	(010-050)	C 61.00		(040-250)	(010-050)	C 61.00	Total	(010-020)	050				
LIQ_10	Firm specific currency concentration (% of total items providing stable funding)	Total items providing stable funding for currency X (A + B) / Total items providing stable funding (C + D)	Quarterly	Gives the concentrations of firm's liabilities in a particular currency, as a proportion of total liabilities	[0,1]	C 61.00.x	Currency X	(040-250)	(010-050)	C 61.00.x	Currency X	(010-030)	050	C 61.00		(040-250)	(010-050)	C 61.00	Total	(010-020)	050
LIQ_11	Cash and trading assets to total assets	Cash and financial assets held for trading (A) / Total assets (B)	Quarterly	A broad measure of liquid assets, as a proportion of total assets	[0,1]	F 01.01		010, 050	010	F 01.01		380	010								
LIQ_12	Cash, trading, and available-for-sale (AFS) assets to total assets	Cash, financial assets held for trading and available-for-sale financial assets (A) / Total assets (B)	Quarterly	A broad measure of liquid assets and financial assets available for sale, as a proportion of total assets.	[0,1]	F 01.01		010, 050, 140	010	F 01.01		380	010

SOLVENCY																					
SVC_1	Tier 1 capital ratio	Tier 1 capital (A) / Total risk exposure amount (B)	Quarterly	It is a measure of the extent to which a financial institution can absorb losses using core components of equity. At the same time, it is a (more stringent than SVC_2) measure of compliance to regulatory capital requirements	[0,1]	C 01.00		015	010	C 02.00		010	010								
SVC_2	Total capital ratio	Own funds (A) / Total risk exposure amount (B)	Quarterly	It is a measure of the extent to which a financial institution can absorb losses using specific equity components. At the same time, it is the most traditional and recognisable measure of compliance to regulatory capital requirements	[0,1]	C 01.00		010	010	C 02.00		010	010								
SVC_3	CET 1 capital ratio	Common equity TIER 1 capital (A) / Total risk exposure amount (B)	Quarterly	It is a measure of the extent to which a financial institution can absorb losses using core components of Tier 1 capital after any convertible components of debt has been eliminated. It is a more prudent measure of loss absorption capacity than the previous two SVCs indicators (SVC 1 and SVC_2)	[0,1]	C 01.00		020	010	C 02.00		010	010								
SVC_4	Credit risk exposure amounts of total risk exposure amounts	Risk-weighted exposure amounts for credit, counterparty credit and dilution risks and free deliveries (A) / Total risk exposure amount (B)	Quarterly	Indicates the participation of credit risk within the total risk-mix calculated for regulatory purposes	[0,1]	C 02.00		040	010	C 02.00		010	010								
SVC_5	SA risk-weighted exposure amounts of total credit risk exposure amounts	SA (A) / Risk-weighted exposure amounts for credit, counterparty credit and dilution risks and free deliveries (B)	Quarterly	Indicates the participation of the SA portfolio credit risk within the total investment portfolio risk calculated for regulatory purposes	[0,1]	C 02.00		050	010	C 02.00		040	010								
SVC_6	Securitisation risk exposure amounts of total risk exposure amounts	Securitisation positions (SA and IRB) (A) / Risk-weighted exposure amounts for credit, counterparty credit and dilution risks and free deliveries (B)	Quarterly	Indicates the participation of the credit risk caused by securitisation (SA or IRB) activity within the total investment portfolio risk calculated for regulatory purposes.	[0,1]	C 02.00		220, 430	010	C 02.00		010	010								

Number	Name	Formula	Frequency	Description	Range of values	Data Point A				Data Point B				Data Point C				Data Point D			
						Template	Sheet	Row	Column	Template	Sheet	Row	Column	Template	Sheet	Row	Column	Template	Sheet	Row	Column
SVC_15	Transitional adjustments due to grandfathered CET 1 Instruments to total Tier 1 capital	Transitional adjustments due to grandfathered CET 1 capital instruments (A) / Tier 1 capital (B)	Quarterly	It measures the extent to which regulatory Tier 1 equity is 'bolstered' by transitional adjustments allowed by the national regulatory authority. Such adjustments are expected to be lifted after 2018.	Greater than 0	C 01.00		220	010	C 01.00		015	010								
SVC_16	IRB shortfall to total Tier 1 capital	[IRB shortfall of credit risk adjustments to EL (A) / Tier 1 capital (B)] x (-1)	Quarterly	The IRB 'shortfall' vis-à-vis accounting provisions' deficit compared to EL is one of the major components that reduce regulatory own funds for IRB institutions. Consistent high prices of the ratio signal that IRB models' extracted results are not materialised into 'accounting provisions or credit adjustments' within the published financial statements	Greater than 0	C 01.00		380	010	C 01.00		015	010								
SVC_17	Net DTA that rely on future profitability to total Tier 1 capital	[Deferred tax assets that rely on future profitability and do not arise from temporary differences net of associated tax liabilities (A) / Tier 1 capital (B)] x (-1)	Quarterly	It is a measure of the 'dependence' of the institution's primary solvency on deferred taxation adjustments. High values indicate that capital adequacy might be adversely affected by tax payment increases	Greater than 0	C 01.00		370	010	C 01.00		015	010								
SVC_18	Adjustments to CET 1 due to prudential filters to total Tier 1 capital	Adjustments to CET 1 due to prudential filters (A) / Tier 1 capital (B)	Quarterly	It is a measure of the effect that CET 1 prudential filters have on the capital adequacy benchmark	Any	C 01.00		250	010	C 01.00		015	010								
SVC_19	Deductible goodwill and other intangible assets to total Tier 1 capital	Goodwill and other intangible assets / Tier 1 capital (A/B * (-1))	Quarterly	It is a further measure of the dependence of the institution's solvency on goodwill and intangible assets. Using transitional adjustments	Greater than 0	C 01.00		300, 340	010	C 01.00		015	010								
SVC_20	Defined benefit plan assets to total Tier 1 capital	Defined benefit pension fund assets (A) / Tier 1 capital (B)	Quarterly	It is a further measure of the dependence of the institution's solvency on transitional adjustments allowed by the national regulatory authority.	Greater than 0	C 05.01		190	010	C 01.00		015	010								
SVC_21	Capital and share premium to total equity	Capital and share premium (A) / Total equity (B)	Quarterly	Indicates the participation of core components of 'accounting own funds to total accounting own funds'. It serves as a CET 1 proxy in case a prudential report of regulatory own funds is not available (e.g. at the end of an interim month of the year)	[0,1]	F 01.03		010, 040	010	F 01.03		300	010								
SVC_22	Accumulated OCI to total equity	Accumulated other comprehensive income (A) / Total equity (B)	Quarterly	It is a measure of the extent to which total equity is affected by (primarily illiquid) 'accrual' components	[0,1]	F 01.03		090	010	F 01.03		300	010								

Number	Name	Formula	Frequency	Description	Range of values	Data Point A				Data Point B				Data Point C				Data Point D			
						Template	Sheet	Row	Column	Template	Sheet	Row	Column	Template	Sheet	Row	Column	Template	Sheet	Row	Column
SVC_30	Total capital ratio (fully phased-in definition)	(Own funds [A] - Transitional adjustments on capital [B]) / (Total risk exposure amount [C] – transitional adjustments on risk exposure amount [D])	Quarterly	The capital ratios in COREP are calculated taking into account the transitional period. For the analysis and the build-up of time series, the use of a stable definition (fully phased-in) is also of interest	Greater than 0	C 01.00		010	010	C 01.00		220, 240, 520, 660, 680, 730, 880, 900,960	010	C 02.00		010	010	C 05.01		010	040
OPERATIONAL RISK																					
OPR_1	Total risk exposure for OpR (% of total risk exposure)	Total risk exposure for OpR / Total risk exposure amount	Quarterly	Indicates the % of OpR exposures over the entire risk exposure of the institution	[0,1]	C 02.00		590	010	C 02.00		010	010								
OPR_2	OpR BIA risk exposure (% of total risk exposure OpR)	OpR BIA - BIA / Total risk exposure for OpR	Quarterly	Indicates the % of OpR exposure calculated using the BIA over the total OpR exposure	[0,1]	C 02.00		600	010	C 02.00		590	010								
OPR_3	OpR STA/ASA risk exposure (% of total risk exposure OpR)	OpR STA/ASA / Total risk exposure for OpR	Quarterly	Indicates the % of OpR exposure calculated using the STA or ASA over the total OpR exposure	[0,1]	C 02.00		610	010	C 02.00		590	010								
OPR_4	OpR AMA risk exposure (% of total risk exposure for OpR)	OpR AMA / Total risk exposure for OpR	Quarterly	Indicates the % of OpR exposure calculated using the AMA over the total OpR exposure	[0,1]	C 02.00		620	010	C 02.00		590	010								
OPR_5	Total OpR loss as % of own funds requirements for OpR	Total loss amount / (Total risk exposure amount for OpR * 0.08)	Semi-annually	Indicates if the capital held for OpR is sufficient to cover OpR losses incurred	Greater or equal to 0	C 17.00		920	080	C 02.00		590	010								
OPR_6	Internal fraud loss as % of total OpR loss	Total loss amount for internal fraud / Total OpR loss amount	Semi-annually	Indicates the proportion of OpR losses caused by internal fraud	[0,1]	C 17.00		920	010	C 17.00		920	080								
OPR_7	External fraud loss as % of total OpR loss	Total loss amount for external fraud / Total OpR loss amount	Semi-annually	Indicates the proportion of OpR losses caused by external fraud	[0,1]	C 17.00		920	020	C 17.00		920	080								
OPR_8	Business disruptions and system failures loss as % of total OpR loss	Total loss amount for business and system failures / Total OpR loss amount	Semi-annually	Indicates the proportion of OpR losses caused by business disruptions and system failures	[0,1]	C 17.00		920	060	C 17.00		920	080

SME RISK INDICATORS																													
SME_1	Share of SME exposures in total exposures	$\frac{[SME\ original\ exposures\ (SA)\ [A] + SME\ original\ exposures\ (IRB)\ [B]]}{[Total\ original\ exposures\ (SA)\ [C] + Total\ original\ exposures\ (IRB)\ [D]]}$	Quarterly	Gives broader information on the weight of SME exposures in total bank exposures. The SME lending is based on the unharmonized SME definitions used by each bank.	[0,1]	C 07.00	001	020	010	C 08.01	007, 008, 013, 016	010	020	C 07.00	001	010	010	C 08.01	001, 002	010	020								
SME_2.1	Share of SME exposures in exposures to the real economy (corporates, retail and secured by immovable property) for SA	$\frac{SME\ original\ exposures\ (SA)\ [A]}{Original\ exposure\ to\ corporates\ and\ retail\ (SA)\ [B]}$	Quarterly	To be able to judge the relative importance of SME lending compared to other lending to the private sector. SA excludes exposures in default.	[0,1]	C 07.00	001	020	010	C 07.00	008, 009, 010	010	010																
SME_2.2	Share of SME exposures in exposures to the real economy (corporates and retail) for IRB Approach	$\frac{SME\ original\ exposure\ (IRB)\ [A]}{Original\ exposure\ to\ corporates\ and\ retail\ (IRB)\ [B]}$	Quarterly	To be able to judge the relative importance of SME lending compared to other lending to the private sector. IRB includes exposures in default.	[0,1]	C 08.01	007, 008, 013, 016	010	020	C 08.01	007, 008, 009, 010, 011, 012, 013, 014, 015, 016, 017	010	020																

SME_3	Share of SME exposures subject to SME Supporting Factor in total exposures	$\frac{\text{[Original exposure s s.t. SF (SA) [A] + original exposure s.t. SF (IRB) [B]]}}{\text{Total original exposure (SA+IRB) [C+D]}}$	Quarterly	<p>Gives broader information on the weight of SME exposures subject to SME Supporting Factor in total bank exposures. The SME lending is based on the harmonized SME definitions subject to Supporting Factor as defined by Article 501 CRR</p> <p>At bank level, comparison of indicators 1 and 2 would show how the 2 SME definitions relate to each other, and at country level, it will show the impact of these differences.</p>	[0,1]	C 07.00	001	030	010	C 08.01	001, 002	015	020	C 07.00	001	010	010	C 08.01	001, 002	010	020										
SME_4	% change (year on year) of SME exposures during the period	$\frac{\text{[SME original exposure s (SA) [A] + SME original exposure (IRB) [B]] Q(t) - [SME original exposure s (SA) [A] + SME original exposure (IRB) [B]] Q(t-4)}}{\text{[SME original exposure s (SA) [A] + SME original exposure (IRB) [B]] Q(t-4)}}$	Quarterly	<p>Gives broader information on the weight of SME exposures in total bank exposures. The SME lending is based on the unharmonized SME definitions used by each bank.</p> <p>Note: this figure does not represent new business, but merely growth in the exposure amount</p>	% positive, null or negative values (expected to stay within 'normal' ranges, for example +/- 10%)	C 07.00 Q (t)	001	020	010	C 08.01 Q (t)	007, 008, 013, 016	010	020	C 07.00	001	020	010	C 08.01	001, 002	010	020										

<p>SME_5</p>	<p>% (year on year) growth of SME exposures subject to SME Supporting Factor during the period</p>	<p>[Original exposure s.t. SF (SA) [A] + original exposure s.t. SF (IRB) [B]] Q(t) - [Original exposure s.t. SF (SA) [A] + original exposure s.t. SF (IRB) [B]] Q(t-4) / [Original exposure s.t. SF (SA) [A] + original exposure s.t. SF (IRB) [B]] Q(t-4)</p>	<p>Quarterly</p>	<p>Gives informations on the development (increase/decrease) of the volume of SME exposures subject to the SME Supporting Factor, independently from their level</p> <p>Note: this figure does not represent new business, but merely growth in the exposure amount</p>	<p>% positive, null or negative values (expected to stay within 'normal' ranges, for example +/- 10%)</p>	<p>C 07.00 Q (t)</p>	<p>001</p>	<p>030</p>	<p>010</p>	<p>C 08.01 Q (t)</p>	<p>001, 002</p>	<p>015</p>	<p>020</p>	<p>C 07.00</p>	<p>001</p>	<p>030</p>	<p>010</p>	<p>C 08.01 Q (t-4)</p>	<p>001, 002</p>	<p>015</p>	<p>020</p>									
<p>SME_6.1</p>	<p>Risk weight ratio for SME exposures for SA</p>	<p>Risk weighted SME exposure after SF (SA) [A] / SME exposure value (SA) [B]</p>	<p>Quarterly</p>	<p>Gives information on the average level of credit risk carried by SME assets (SA), keeping in mind that the SME/SF has also been applied to some assets.</p> <p>Note: This figures will incorporate the CRM with substitution effects, which means that some SME exposures may be reported as another exposure class for the purpose of risk weighting</p>	<p>% positive values (0-100%). In some rare cases, depending on types of assets, RW ratio could be > to 100%.</p>	<p>C 07.00</p>	<p>001</p>	<p>020</p>	<p>220</p>	<p>C 07.00</p>	<p>001</p>	<p>020</p>	<p>200</p>																	

SME_6.2	Risk weight ratio for SME exposures for IRB Approach	Risk weighted SME exposures after SF (IRB) [A] / SME exposure value (IRB) [B]	Quarterly	Gives information on the average level of credit risk carried by SME assets (IRB), keeping in mind that the SME/SF has also been applied to some assets. Note: This figures will incorporate the CRM with substitution effects, which means that some SME exposures may be reported as another exposure class for the purpose of risk weighting	% positive values (0-100%). In some rare cases, depending on types of assets, RW ratio could be > to 100%.	C 08.01	007, 008, 013, 016	010	260	C 08.01	007, 008, 013, 016	010	110																			
SME_7.1	Risk weight ratio for SME exposures subject to SME Supporting Factor for SA	Risk weighted exposures s.t. SF after SF (SA) [A] / Exposure value of exposures s.t. SF (SA) [B]	Quarterly	Gives information on the average level of credit risk carried by SME/SF assets (SA)	% positive values (0-100%). In some rare cases, depending on types of assets, RW ratio could be > to 100%.	C 07.00	001	030	220	C 07.00	001	030	200																			
SME_7.2	Risk weight ratio for SME exposures subject to SME Supporting Factor for IRB Approach	Risk weighted exposures s.t. SF after SF [A] / SME/SF exposure value (IRB) [B]	Quarterly	Gives information on the average level of credit risk carried by SME/SF assets (IRB)	% positive values (0-100%). In some rare cases, depending on types of assets, RW ratio could be > to 100%.	C 08.01	001, 002	015	260	C 08.01	001, 002	015	110																			
SME_8	Probability of default for SME exposures (IRB only)	Σ (Internal rating system - PD assigned to the obligor grade or pool [A] * Exposure value [B]) / weighted by exposure value [C]	Quarterly	Gives information on the probability of default associated to SME exposures in case of IRB banks Note: Part of the information on the expected and unexpected loss is captured by LGD, which is not available.	[0,1]	C 08.01	007, 008, 013, 016	010	010	C 08.01	007, 008, 013, 016	010	110	C 08.01	007, 008, 013, 016	010	110															

<p>SME_13</p>	<p>% change (year-on-year) of defaulted SME exposures during the period</p>	<p>SME Exposures in default SA [A] + SME exposures in default IRB [B] Q(t) - [SME Exposures in default SA [C] + SME exposures in default IRB [D]] Q(t-4) / [SME Exposures in default SA [C] + SME exposures in default IRB [D]] Q(t-4) Sum of all countries</p>	<p>Quarterly</p>	<p>Gives informations on the development (increase/decrease) of defaulted SME exposures, independently from their level</p>	<p>% positive, null or negative values (expected to stay within 'normal' ranges, for example +/- 10%)</p>	<p>C 09.01 Q(t)</p>	<p>NA</p>	<p>075 085 095</p>	<p>020</p>	<p>C 09.02 Q(t)</p>	<p>NA</p>	<p>050 080 120</p>	<p>030</p>	<p>C 09.01 Q(t-4)</p>	<p>NA</p>	<p>075 085 095</p>	<p>020</p>	<p>C 09.02 Q(t-4)</p>	<p>NA</p>	<p>050 080 120</p>	<p>030</p>									
<p>SME_14</p>	<p>Post-CRM SME exposure to original SME exposure</p>	<p>SME exposure value (SA+IRB) [A+B] / SME Original exposure (SA+IRB) [C+D]</p>	<p>Quarterly</p>	<p>Gives information on the SME dependency on credit protection (SA+IRB). Can be compared to the same values of all exposures as calculated in AQT 14. Note: Only Totals can be used due to the flow of amounts across exposure classes for reporting purposes following CRM. This figure captures only credit protection that leads to the reduction in exposure value.</p>	<p>[0,1]</p>	<p>C 07.00</p>	<p>001</p>	<p>020</p>	<p>200</p>	<p>C 08.01a</p>	<p>007, 008, 013, 016</p>	<p>010</p>	<p>110</p>	<p>C 07.00</p>	<p>001</p>	<p>020</p>	<p>010</p>	<p>C 08.01</p>	<p>007, 008, 013, 016</p>	<p>010</p>	<p>020</p>									

SME_15	Post-CRM SME exposure subject to SME Supporting Factor to original exposure	Exposure value on exposures s.t. SF (SA+IRB) [A+B] / SME Original exposure (SA+IRB) [C+D])	Quarterly	Gives information on the dependency of SME exposures to the SME Supporting Factor on credit protection (SA+IRB). Can be compared to the same values of all exposures as calculated in AQT 14. Note: Only Totals can be used due to the flow of amounts across exposure classes for reporting purposes following CRM. This figure captures only credit protection that leads to the reduction in exposure value.	[0,1]	C 07.00	001	030	200	C 08.01	001,002	015	110	C 07.00	001	030	010	C 08.01	001,002	015	020								
SME_16	Increase in CET1 capital ratio with the application of SME supporting factor	$\frac{[CET1 (A) / Total Risk Exposure Amount [B]] - [CET1 (A) / [Total Risk Exposure Amount [B] + Risk weighted exposure amount before SF (SA+IRB) [C + D] - Risk weighted exposure amount after SF (SA+IRB) [E + F]]}{}$	Quarterly	Increase in the Common Equity Tier 1 Capital associated to the application of the SME Supporting Factor	p.p. positive values	C 01.00	NA	020	010	C 02.00	NA	010	010	C 07.00.a	001	030	215	C 08.01	001,002	015	255	C 07.00	001	030	220	C 08.01	s001, s002	015	260

DRATs

Number	Name	Formula	Frequency	Description	Expected values	Data Point A				Data Point B				Data Point C			
						Template	Sheet	Row	Column	Template	Sheet	Row	Column	Template	Sheet	Row	Column
I. MATRICES OF CONCENTRATION																	
DRAT 1	Distribution matrix of original exposure by sector and country	See 'Matrix1'	Quarterly	Double entry matrix with row axis being countries and column axis being sector groups. Sector grouping could be defined as a mapping between SA and IRB sectors so as to allow an aggregation of exposures	[0,1]	C 09.01a	All	All except 100	010	C 09.01b	All	All	020	C 09.02	All	All	010
DRAT 2	Distribution matrix of defaulted exposure by sector and country	See 'Matrix1'	Quarterly	Double entry matrix with row axis being countries and column axis being sector groups	[0,1]	C 09.01b	All	All	020	C 09.02	All	All	030				
DRAT 3	Distribution matrix of observed new defaults by sector and country	See 'Matrix1'	Quarterly	Double entry matrix with row axis being countries groups and column axis being sector groups	[0,1]	C 09.01b	All	All	040	C 09.02	All	All	040				
DRAT 4	Distribution matrix of provision coverage ratio by sector and country	See 'Matrix1'. Coverage ratio = (General credit risk adjustments + Specific credit risk adjustments - Of which write-offs) / Exposure in default	Quarterly	Double entry matrix with row axis being countries and column axis being sector groups. Ratio is a proxy		C 09.01a	All	All	{050, 055, 060}	C 09.01b	All	All	020	C 09.02	All	All	{030, 050, 055, 060}
DRAT 5	Distribution matrix of write-offs by sector and country	See 'Matrix1'	Quarterly	Double entry matrix with row axis being countries and column axis being sector groups		C 09.01a	All	All	060	C 09.02	All	All	060				
DRAT 6	Distribution matrix of RWA by sector and country of non-defaulted exposures	See 'Matrix1'. Minimum [RWA before SME supporting factor, RWA after SME supporting factor]_SA + Minimum [RWA before SME supporting factor, RWA after SME supporting factor]_IRB - RWA of which: defaulted IRB	Quarterly	Double entry matrix with row axis being countries and column axis being sector groups. As there is no geographical breakdown of RWA of defaulted exposures by asset class for the SA, we subtract that figure from the IRB (C 09.02 - Row 120)		C 09.01a	All	All except 100	{080, 090}	C 09.02	All	All	{110, 120, 125}				
DRAT 7	Distribution matrix of own funds requirements for credit risk (as calculated for capital buffers) by country	See 'Matrix1'	Quarterly	Double entry matrix with countries in rows and the own funds requirements for credit risk as the only column of the template		C 09.03	All	010	010								
DRAT 8	Distribution of overall losses from property by country group	Matrix2	Half-annually	Indicates the proportion of losses from property collateralised exposures for RRE and CRE individually across region groups. A total column would indicate total losses across regions		C 15.00	All	All	030								
DRAT 9	Distribution of loss rates from property by country	Matrix2 // A/B	Half-annually	Indicates a loss rate over collateralised exposure for RRE, CRE and combined by country		C 15.00	All	All	030	C 15.00	All	All	050				
DRAT 10	Distribution of FINREP assets and off-balance-sheet items by country	Matrices 3 and 4	Quarterly	Indicates the proportion of assets across different sectors over countries		F 20.04	All	All	010	F 20.05.a	All	All	010				
DRAT 11	Distribution of FINREP default rates by assets and off-balance-sheet items and by country	See 'Matrix3'. Default rate = Of which: non-performing / Carrying amount	Quarterly	Indicates default rates across different sectors over countries		F 20.04	All	All	{010, 020}	F 20.05.a	All	All	All				
DRAT 12	Distribution of FINREP coverage ratios by assets and off-bze items and by country	See 'Matrix3'. Coverage ratio = Accumulated impairment and changes in fair value due to credit risk / Of which: non-performing	Quarterly	Indicates coverage ratios across different sectors over countries. Ratio may be greater than 1 when there are impairment provisions on exposures that are impaired but not defaulted. Ratio is a proxy, as the template does not provide impaired exposures		F 20.04	All	All	{025, 030}	F 20.05.a	All	All	025	F 20.05.b	All	All	030
DRAT 13	Distribution of loans and advances to non-financial corporations by NACE codes and country	Gross carrying amount per NACE code / Loans and advances ('Matrix5')	Quarterly	Indicates the % of loan and advances per NACE code by country		F 20.07	All	All	010								
DRAT 14	Distribution of loans and advances cumulative impairments by NACE codes and country	Accumulated impairment or changes in fair value due to credit risk per NACE code / Total impairment in	Quarterly	Indicates the % of cumulative impairment per NACE code and country over total impairments in loan and advances		F 20.07	All	All	020								

		loans and advances ('Matrix5')																
DRAT 15	Distribution of liquid assets among currencies	'Matrix6'	Quarterly (monthly also possible)	This matrix, covering all banks, will show how many of the liquid assets are held in the euro and in other currencies		C 51.00	All	(010-390)	020 (if not available, 030; if not available, 040)									
DRAT 16	Total inflows minus outflows by currencies (A - B)	'Matrix6'	Quarterly (monthly also possible)	This matrix, covering all banks, will show the net flows in all currencies. It would need to aggregate all the items reported in templates C 52.00 and C 53.00		C 53.00	All	(010-980)	010 (if any, also 030 and 050)	C 52.00	All	(020-1370)	010 for rows 020-950, 1060-1130 and 1220-1370; 010 and 030 for rows 960-1040; 050 for row 1050; 030 for rows 1140-1210					
DRAT 17	Exposures by sector (all portfolios)	Matrix of exposure to each sector (all portfolios) / Total exposures (A/B) ['Matrix7']	Quarterly	Share of exposure to each sector (sum F04.01-F04.04) to total exposures		F 04.01-04		(030-50, 070-110, 130-180) for F 04.01, F 04.02 and F 04.03; (020-060), (080-130), (160-200), (220-270) for F 04.04	010 for F 04.01 and F 04.02; 030 for F 04.03; 060 for F 04.04									
DRAT 18	Exposures by sector (trading book)	Matrix of exposure to each sector (all portfolios) / Total exposures (A/B) ['Matrix7']	Quarterly	Share of exposure to each sector in the trading book to total trading book exposures		F 04.01		(030-50, 070-110, 130-180)	010									

II. RANKINGS OF COUNTERPARTIES FROM LARGE EXPOSURES

DRAT 19	Top 10 counterparties classified as institutions	Top 10 institutions to which EU banks are exposed (top 10 as per Article 394(2) of the CRR and those larger than EUR 300 million)	Quarterly	All the exposures to institutions (C 27.00 c070 = 'I') reported in C 28 (both the top 10 or those larger than EUR 300 million) are aggregated and a ranking is made with those with larger amounts		C 27.00	All	070		C 28.00	All	040						
DRAT 20	Top 10 counterparties classified as unregulated financial entities	Top 10 unregulated financial entities to which EU banks are exposed (top 10 as per Article 394(2) of the CRR and those larger than EUR 300 million)	Quarterly	All the exposures to unregulated financial entities (C 27.00 c070 = 'U') reported in C 28 (both the top 10 or those larger than EUR 300 million) are aggregated and a ranking is made with those with larger amounts		C 27.00	All	070		C 28.00	All	040						
DRAT 21	Top 10 counterparties classified as non-financial corporations	Top 10 non-financial corporations to which EU banks are exposed (top 10 as per Article 394(2) of the CRR and those larger than EUR 300 million)	Quarterly	All the exposures to non-financial corporations (C 27.00 c050 = 'non-financial corporations') reported in C 28 (both the top 10 or those larger than EUR 300 million) are aggregated and a ranking is made with those with larger amounts		C 27.00	All	050		C 28.00	All	040						
DRAT 22	Top 10 counterparties classified as institutions by number of large exposures	Top 10 institutions to which EU banks are exposed (top 10 as per Article 394(2) of the CRR and those larger than EUR 300 million) in terms of the	Quarterly	All the exposures to institutions (C 27.00 c070 = 'I') reported in C 28 (both the top 10 or those larger than EUR 300 million) are counted and a ranking is made with those which appear more often		C 27.00	All	070		C 28.00	999							

		number (not amounts) of large exposures																
DRAT 23	Top 10 counterparties classified as unregulated financial entities by number of large exposures	Top 10 unregulated financial entities to which EU banks are exposed (top 10 as per Article 394(2) of the CRR and those larger than EUR 300 million) in terms of the number (not amounts) of large exposures	Quarterly	All the exposures to unregulated financial entities (C 27.00 c070 = 'U') reported in C 28 (both the top 10 or those larger than EUR 300 million) are counted and a ranking is made with those which appear more often		C 27.00	All	070	C 28.00		999							
DRAT 24	Top 10 counterparties classified as non-financial corporations by number of large exposures	Top 10 non-financial corporations to which EU banks are exposed (top 10 as per Article 394(2) of the CRR and those larger than EUR 300 million) in terms of the number (not amounts) of large exposures	Quarterly	All the exposures to non-financial corporations (C 27.00 c050 = 'non-financial corporations') reported in C 28 (both the top 10 or those larger than EUR 300 million) are counted and a ranking is made with those which appear more often		C 27.00	All	050	C 28.00		999							
III. RANKINGS OF DEFAULTED AND NON-PERFORMING EXPOSURES																		
DRAT 25	Ranking of countries according to non-performing exposures (EUR million)	Top 10 countries ranked according to the total amount of non-performing exposures	Quarterly	Starting from template F 20.04, non-performing exposures are aggregated for all institutions and countries are ranked starting with those with larger non-performing exposures in absolute amounts		F 20.04		010, 040, 080, 140	025									
DRAT 26	Ranking of countries according to non-performing exposures to total financial assets	Top 10 countries ranked according to the total amount of non-performing exposures as a % of financial assets	Quarterly	Starting from template F 20.04, non-performing exposures are aggregated for all institutions and countries are ranked starting with those with larger non-performing exposures in relative terms (A / B)		F 20.04		010, 040, 080, 140	025	F 20.04		010, 040, 080, 140	010					
IV. LIQUIDITY AND FUNDING INFORMATION																		
DRAT 27	Liquid assets to items requiring stable funding ratio by currency	Liquid assets to items requiring stable funding ratio by currency (A / B)	Quarterly (monthly also possible)	Templates C 51.00 and C 60.00 would be aggregated by currency (sheet) and then the indicator LIQ 7 would be calculated over that total amount		C 51.00	All	(010-390)	020 (if not available, 030; if not available, 040)	C 60.00	All	(010-1310)	(010-150)					
DRAT 28	Term funding per currency	Term retail deposits + Term liabilities from customers that are not financial customers + Term liabilities from customers that are financial customers (A) / Total items providing stable funding (B) by currency	Quarterly (monthly also possible)	Template C 61.00 would be aggregated by currency (sheet) and then the indicator LIQ 9 would be calculated over that total amount		C 61.00	All	(040-200)	(020-050)	C 61.00	All	(010-250)	(010-050)					
V. ASSET QUALITY MATRICES																		
DRAT 29	Average LGD per exposure class	Exposure weighted average LGD in %, per exposure class, as per Matrix8	Quarterly	Gives information on the LGD for those defaulted exposures under IRB.		C 08.01		010	230-240									
DRAT 30	Average PD of IRB exposures by exposure class	PD assigned to total exposures [A]. See Matrix8	Quarterly	Gives information on the average PD on total IRB exposures, defaulted or not	% positive values (0-100%); expected to stay within 'normal' ranges and not vary too much from one period to another	C 08.01		010	010									

DRAT 31	Average PD of non-defaulted IRB exposures by exposure class	(Calculated PD for non-defaulted exposures only) --> sum of (assigned PD * exposure value of non-defaulted class) [A*B] / Sum of (exposure value of non-defaulted classes) [C]. See Matrix8	Quarterly	Gives information on the average PD on total IRB exposures without taking defaulted exposures into account	% positive values (0-100%); expected to stay within 'normal' ranges and not vary too much from one period to another	C 08.02		(for each class) PD<100% (not fixed rows)	010	C 08.02		(for each class) PD<100% (not fixed rows)	110	C 08.02		(for each class) PD<100% (not fixed rows)	110
