Summary*

The CET1 ratio increased again slightly in Q1 2021. It reached 15.6% on a fully loaded basis amid a nearly parallel rise of the numerator (CET1 capital) and denominator (risk weighted assets, RWA). The latter came in parallel to an increase in total assets. The leverage ratio declined from 5.8% in Q4 2020 to 5.6% in Q1 2021 on a fully loaded basis, as the increase in capital could not compensate for the rise of the denominator. The rise in total assets was driven by a significant increase in cash balances (including deposits with central banks). Also loans to households and non-financial corporates (NFCs) rose. The RWA composition showed a growing share of credit RWA (up from 82.6% in Q4 to 83.5% in Q1), whereas the share of operational RWA contracted (from 10.1% to 9.7%). Other components remained roughly stable quarter on quarter (QoQ).

The NPL ratio declined despite a slight rise in NPL volumes. It reached 2.5%, down by 10bps compared to the previous quarter. The 5th/95th percentile ranges from 0.2% (unchanged QoQ) to 10.1% (10.7% in Q4), showing that banks with particularly high ratios managed to reduce them. On segment level, the NPL ratios remained stable for household exposures (2.9%), and slightly contracted for loans to NFCs (from 4.8% to 4.7%). For NFC exposures, even though the NPL ratio declined or remained stable for nearly all sectors, it rose for some of them. The biggest increase was among accommodation and food services (further up from 8.4% to 9.0% QoQ) as well as arts, entertainment and recreation (further up from 7.2% to 7.9%). Forborne loans rose by 7.6% in Q1. However, amid the even more pronounced rise of the denominator the forbearance ratio remained unchanged at 2.0%. The Heatmap shows that there was a particularly pronounced move of banks with a ratio below 1.5% into the segment of banks with an average ratio of 1.5% to 4.0% (the former is down from 51.1% to 41.9%, the latter up from 40.7% to 49.8%). The share of banks with a ratio above 4% remained nearly unchanged (8.3% in Q1 vs. 8.2% in Q4). The stage ratio 2 ratio slightly declined from 9.1% to 9.0% in Q1.

Loans under EBA eligible moratoria declined further in Q1 2021. They reached around EUR 203bn (around EUR 318bn in Q4 2020). The decline was again more pronounced for NFC exposures than for loans to households. Whereas the share of stage 2 loans under moratoria remained nearly stable at 27.3% (27.2% in Q4 2020), the NPL ratio showed a significant rise. It stood at 3.9% in Q1 2021, 60bps up since Q4 2020. For loans with expired moratoria, the stage 2 ratio reached 23.7% (20.2% in the previous quarter) and the NPL ratio was 4.5% (4.0% in the previous quarter). The latter also shows an extremely wide dispersion among countries, ranging from 0.4% to 21.2%. The rise in loans under public guarantee schemes (PGS) slowed down, reaching around EUR 378bn in Q1, up from EUR 343bn as of YE 2020. Both, the stage 2 and NPL ratios were on the rise for PGS exposures, from 11.7% to 13.6% for the former and from 1.1% to 1.4% for the latter. Also the share of exposures, which is covered by the guarantees, further rose from 71.1% to 77.5% QoQ.

Profitability improved strongly. Return on equity (RoE) rose to 7.6% in Q1 2021 from 1.9% as of YE2020, an all time high for the periods covered by the Risk Dashboard (since 2014), driven by contracting cost of risk as well as rising fee & commission and trading income. Cost of risk fell from 75bps to 53bps QoQ, with the 5th/95th percentile ranging from -5bps to 186bps, showing a wide dispersion among banks. Fee & commission income as share of equity rose from 9.0% to 9.6% and trading income from 1.6% to 3.6%. Net interest income as share of equity, in contrast, declined from 17.4% to 17.1%. The net interest margin (NIM) significantly contracted from 133bps to 124bps, ranging from 75bps up to 302bps among countries. The cost to income ratio declined from 65.2% in Q4 2020 to 63.6% in Q1 2021, with a bigger increase of the denominator than the numerator. The rise in the latter is similarly reflected in other than staff related administrative expenses as share of equity, which rose from 8.1% as of YE 2020 to 8.3% in Q1 2021. Also provisions as share of equity rose from 0.8% to 1.0% in the same period. Staff expenses as share of equity declined from 10.2% to 10.1% QoQ.

The loan to deposit ratio declined further from 112.2% in Q4 to 111.0% in Q1, supported by a bigger rise in client deposits from households and NFCs than respective loans. The asset encumbrance ratio increased from 27.9% as of YE 2020 to 28.8% in Q1 2021, presumably not least due to a further rise in central bank funding (TLTRO3) during the quarter. The liquidity coverage ratio (LCR) reached 173.7% in Q1 (173.0% in Q4).

*This risk dashboard is based on a sample of Risk Indicators (RI) from 161 European banks (unconsolidated number of banks, including 30 subsidiaries). The sample of banks is reviewed annually by competent authorities and adjusted accordingly. This can determine breaks in the time series. In particular, from Q1 2020 onwards, EU aggregates no longer include figures for UK banks but for subsidiaries of UK banks in EU countries. Ratios provided in the text are weighted average if not otherwise stated. The data is based on the EBA's implementing technical standards (ITS) on supervisory reporting (EU Regulation No 680/2014 and its subsequent amendments). In the chart on Risk Indicators by size class, considering the distribution of the average total assets, the small banks are those below the first quartile, the large banks are those above the third quartile.

Overview of the main risks and vulnerabilities in the EU banking sector

Risk measure	Developments		Short-term outlook	Description
	Risk level			
	Last risk dash-board	Current		

Asset quality → **Short-term outlook:** The ECB's Bank Lending Survey for Q1 2020 points to rather subdued demand and further tightening of lending standards but credit growth will also depend on the pace of the economic recovery. Although vaccine rollouts have accelerated and containment measures are being gradually lifted, the risks related to the emergence of new COVID-19 variants for which existing vaccines may not be effective remain elevated. Banks are still vulnerable, in particular those with higher exposures towards economic activities that are more reliant on social contact and mobility. Also supply chain shortages add to the COVID-19 related concerns. Improving macroeconomic conditions, a large stock of non-financial corporation (NFC) deposits and early debt restructuring – where needed – might limit NPL formation. However, if the phase-out of fiscal, monetary, and regulatory support measures is not managed carefully, potential cliff effects might be triggered. Concentration risk arising from central counterparties (CCPs) domiciled in the UK need close monitoring, in particular in light of expiry of the European Commission's equivalence decision in June 2022, which aimed to provide financial market participants time to reduce their exposure to respective CCPs.

Market risk ↓ **Short-term outlook:** Unexpected developments in the COVID-19 pandemic might reverse the positive mood of financial markets. Central bank responses to inflationary pressures could trigger abrupt movements in yields and volatility. In particular riskier market segments such as equity or currencies of emerging economies might suffer abrupt corrections in case of sudden capital outflows. Increase in firms and sovereign funding costs could also raise creditworthiness concerns and lead to spread widening. Even though a rising share of financial market participants seems to be prepared for the upcoming LIBOR cessation, there might be significant exposures relying on them also after their termination.

Liquidity and funding → **Short-term outlook:** Although the increase in absolute yields affects wholesale financing costs, given current tight debt spreads, abundant liquidity buffers, and the availability of extraordinary central bank facilities, banks are not expected to face major funding pressures. Nonetheless, a potentially continued rise in the encumbrance ratio of central bank eligible assets might limit the capacity of some banks to resort to this source of financing in periods of market stress. In the medium-term, the phase out of central bank facilities may prove challenging for some institutions more dependent on them.

Profitability ↓ **Short-term outlook:** In the context of rising absolute yields, if the funding repricing is faster than repricing of assets, net interest margins could be additionally hit. The increasing share of low margin exposures could additionally affect net interest income. Banks' clients might be further incentivised to shift their savings from near zero or negative yielding deposits to riskier asset management products. Although this could result in increasing fee income, strong competition, including from non-banks, might limit the upside. Many banks still need to streamline their operational structure to guarantee their long-term viability. This requires further digital investment and the rationalisation of branch networks and might entail substantial costs in the short and medium-term. It remains to be seen whether the accumulated impairments are adequate to cover upcoming NPLs or banks will need to incur additional provisions.

Operational resilience ↑ Amid an increasing use of digital channels by clients and a substantial share of banks' employees working remotely, hardware, software or telecommunication malfunctioning might cause significant disruptions in banks' operations. Cyber-attacks have become more frequent and aggressive. The ransomware episodes mainly observed in other economic sectors could similarly affect banks. Anti-money laundering (AML) issues reveal that their legal, economic, and reputational consequences can last for several years and might affect not only the involved institutions but the entirety of the banking sector. Inadequately addressed environmental, social or governance (ESG) factors might have detrimental consequences on banks. New types of misconduct related to COVID-19 support measures might emerge.

(1) In disclosing aggregated information on the real estate (RE) exposures towards the different national RE markets in the Union, the EBA made use of information in regulatory reporting templates that provide a breakdown of credit exposures. RE exposures are identified as those referred to as both the NACE codes 'F' and 'L', although strictly speaking some sub-categories would need to be excluded following the Commercial Real Estate (CRE) definition adopted in the ESRB Recommendation.

(2) Data is country aggregated on the basis of the residence of the immediate counterparty. The information on the geographical distribution of exposures by country is reported by institutions where non-domestic original exposures in all 'non-domestic' countries in all exposures classes are equal or higher than 10 % of total domestic and non-domestic original exposures. For this purpose exposures shall be deemed to be domestic where they are exposures to counterparties located in the Member State where the institution is located.

Individual country data includes subsidiaries, which are excluded from EU aggregate. For example, at country level the subsidiary in country X of a bank domiciled in country Y is included both in data for countries X and Y (for the latter as part of the consolidated entity). In the EU aggregate, only the consolidated entity domiciled in country Y is considered. The sample of banks is unbalanced and reviewed annually. Being an unbalanced sample, the number of reporting banks per country can display minor variations between quarters, which might accordingly affect quarterly changes in absolute and relative figures. As of Q1 2020 onwards UK banks are removed from the EU/EEA aggregate and subsidiaries of UK banks in EU member states are used instead.

(1) Applicable only to IFRS reporting banks.
 Individual country data includes subsidiaries, which are excluded from EU aggregate. For example, at country level the subsidiary in country X of a bank domiciled in country Y is included both in data for countries X and Y (for the latter as part of the consolidated entity). In the EU aggregate, only the consolidated entity domiciled in country Y is considered. The sample of banks is unbalanced and reviewed annually. Being an unbalanced sample, the number of reporting banks per country can display minor variations between quarters, which might accordingly affect quarterly changes in absolute and relative figures. As of Q1 2020 onwards UK banks are removed from the EU/EEA aggregate and subsidiaries of UK banks in EU member states are used instead.

Individual country data includes subsidiaries, which are excluded from EU aggregate. For example, at country level the subsidiary in country X of a bank domiciled in country Y is included both in data for countries X and Y (for the latter as part of the consolidated entity). In the EU aggregate, only the consolidated entity domiciled in country Y is considered. The sample of banks is unbalanced and reviewed annually. Being an unbalanced sample, the number of reporting banks per country can display minor variations between quarters, which might accordingly affect quarterly changes in absolute and relative figures. As of Q1 2020 onwards UK banks are removed from the EU/EEA aggregate and subsidiaries of UK banks in EU member states are used instead.

Individual country data includes subsidiaries, which are excluded from EU aggregate. For example, at country level the subsidiary in country X of a bank domiciled in country Y is included both in data for countries X and Y (for the latter as part of the consolidated entity). In the EU aggregate, only the consolidated entity domiciled in country Y is considered. The sample of banks is unbalanced and reviewed annually. Being an unbalanced sample, the number of reporting banks per country can display minor variations between quarters, which might accordingly affect quarterly changes in absolute and relative figures. As of Q1 2020 onwards UK banks are removed from the EU/EEA aggregate and subsidiaries of UK banks in EU member states are used instead. Other expenses include for instance taxes, extraordinary effects, impact from discontinued operations, impairment or (-) reversal of impairment on non-financial assets. These expenses are shown with a positive sign (like in the columns to the left). In case there are effects resulting in negative expenses (i.e. a positive income) they have a negative sign.

Individual country data includes subsidiaries, which are excluded from EU aggregate. For example, at country level the subsidiary in country X of a bank domiciled in country Y is included both in data for countries X and Y (for the latter as part of the consolidated entity). In the EU aggregate, only the consolidated entity domiciled in country Y is considered. The sample of banks is unbalanced and reviewed annually. Being an unbalanced sample, the number of reporting banks per country can display minor variations between quarters, which might accordingly affect quarterly changes in absolute and relative figures.

Methodological note

Risk Indicators' (RIs) heatmap

The heatmap provides a quick overview of the main RIs, in which it is possible to find the category, number and designation of the specific RI, its historic development and the three buckets in which each data point is assigned to across time (green for the “best” bucket, yellow for the intermediary one and red for the “worst” bucket). The “sample of reporting banks” returns the actual number of banks that submitted the expected data for that reference date (consolidated view).

For each of the RIs' quarterly data, the distribution across the three buckets is computed in respect of the sum of total assets for all banks that are included in the EBA's reporting sample in each reference date. From reference periods March 2020 onwards, the sum of total assets no longer includes UK banks.. Thus, if we observe any given bucket increasing its percentage, we immediately acknowledge that more assets are being assigned to that bucket. However, this does not necessarily mean that more banks are comprised within the bucket (the sum of total assets for all banks is fixed, as well as the total assets from each bank taken individually).

The traffic light of each RI can assume three colours (green, yellow and red) depending on the latest developments on the “worst” bucket of the RI comparing to the whole time series. If the “worst” bucket is progressing positively (i.e. in case fewer assets are being assigned to it), the traffic light should be moving away from red getting closer to green. The colour is computed considering the 33rd and the 67th percentile of the time series.

To help reading the heatmap, let us consider the example of the cost to income ratio:

The green traffic light for the ratio points to the good behaviour of this RI in the last quarter relating to past observations.

More than just declaring if the “worst” bucket has more or less percentage of assets assigned to it, this traffic light approach delivers simultaneously an insight to the latest developments in the RI's “worst” bucket and to the relative position of that data point comparing to all other observations in the same bucket.

The Risk Assessment (RA) meter summarizes the developments in all the KRIs included in the heatmap, providing a single measure. It is computed as the weighted average across the KRIs sum of total assets in the "intermediate" and "worst" bucket. The average is weighted in order to guarantee that each KRI category (solvency, credit risk and asset quality, earnings and balance sheet structure) receives the same weight. Since each category includes a different number of KRIs, the weight of each KRI is thus different. The risk perception increases with higher values of the RA meter: the closer to 100%, the higher the risk.

[1] The data points refer to the latest version of either FINREP tables ("F") or COREP tables ("C") (<http://www.eba.europa.eu/regulation-and-policy/supervisory-reporting/implementing-technical-standard-on-supervisory-reporting>). For more information regarding the Risk Indicators formulas, applicable to each reporting framework, please see the List and Methodological Guide available here (<http://www.eba.europa.eu/risk-analysis-and-data/risk-indicators-guide>).

[2] For the calculation of the average the previous December figure is used as an "anchor" for the subsequent year, and the second number is taken from the latest quarter observation, i.e. Q1, Q2, Q3 or Q4.

[3] Applicable only to IFRS reporting banks. For nGAAP banks the formula is: Increases and other adjustments in allowances: due to amounts set aside for estimated loan losses during the period + Decreases due to amounts reversed for estimated loan losses during the period) (A) / Total gross loans and advances subject to impairment (B + C + D)

[4] Encumbered assets (recognised on the balance sheet) are considered at their carrying value, collateral received is considered as at fair value.

(1) The data points refer to the latest version of either FINREP tables ("F") or COREP tables ("C") (<http://www.eba.europa.eu/regulation-and-policy/supervisory-reporting/implementing-technical-standard-on-supervisory-reporting>). For more information regarding the Risk Indicators formulas, applicable to each reporting framework, please see the List and Methodological Guide available here (<http://www.eba.europa.eu/risk-analysis-and-data/risk-indicators-guide>).

(2) For the calculation of the average the previous December figure is used as an "anchor" for the subsequent year, and the second the number is taken from the latest quarter observation, i.e. Q1, Q2, Q3 or Q4.

(3) Applicable only to IFRS reporting banks.

(4) The formula presented in this document for this risk indicator differs from the formula presented in the EBA list of risk indicators published on the EBA website, which will be subject to future revision.
